VOLUME V ISSUE XII • Devoted to the 68XX User • December 1983
"Small Computers Doing Big Things"

SERVING THE 68XX USER WORLDWIDE

FREE FROM LIMITATIONS, A TEACHER CAN UNLOCK IMAGINATIONS.

By 1985, fully 75% of all jobs will involve computers. So for today's teachers, selecting the right computer is an awesome responsibility. It's a decision you can feel confident about with Southwest Technical Products Corporation's S+ computer system. The S+ is specially designed for a student's tomorrow and a teacher's today. It's built tough. It's simple to operate. You can teach without becoming a hardware specialist.

The S+ is fluent in a variety of languages: BASIC, PASCAL, COBOL, FORTRAN, PILOT.

FORTH, "C," and MUMPS and allows you simultaneous use in the classroom. This flexibility enables you to use your own curriculum, not a machine's version. The system also allows for individual learning styles. Students go as fast and as far as the teacher chooses.

Even though it's priced like a smaller personal computer, the S+ has the multi-task power and expansion abilities of a professional computer. It can grow with you and your students.

Tomorrow is in your hands.

today. Call Fisher Scientific, exclusive distributor of our S+ system, and you'll get the key to unlock imaginations.

For more information. Call toll-free 800-621-4769. Illinois customers call collect (312) 378-7770.

MICROWARE'S OS-9 IS NUMBER ONE.

OS-9 NOW HAS THE LARGEST USER COMMUNITY

More users now run OS-9 on their 6809 computers than all other operating systems combined. This outstanding success story was no accident — it's due to OS-9's technical excellence backed up by outstanding Microware support. OS-9's Unix-type architecture and totally modular design gives your computer more power and versatility. OS-9 also gives you more possibilities for customization so you can tailor your system exactly to your needs. And aren't flexibility and performance the reasons you chose a 6809 computer to begin with?

OS-9 HAS BEEN CHOSEN BY OVER 50 6809 SYSTEM MANUFACTURERS

OS-9 is now offered as a standard operating system by almost every 6809 system manufacturer, and has been designed into an amazing variety of dedicated systems and products including personal and business computers, process control systems, data and telecommunications systems, and more. In all, over 50 companies and organizations have

obtained OS-9 distribution licenses including such well-known names such as General Motors, NASA, Fujitsu, Western Electric, Motorola, Sykes Datatronics, Eastman Kodak, Thomson-CSF, and Tandy Corp.

OS-9 GIVES YOU A SOFTWARE BASE TO BUILD ON

Whatever your application, OS-9 speaks your language! Microware offers BASIC09, an Extended/Structured Basic, a complete C Compiler, a full ISO Pascal Compiler, the ANSI Standard CIS Cobol Compiler, plus Relocatable Macro Assembler. These high performance programming languages are all fully implemented and deliver unmatched performance and outstanding features. Additionally, OS-9 compatible applications packages such as word processors, screen editors, spreadsheets, business software, and utilities are offered by a rapidly growing number of third-party software houses.

PLUS OUTSTANDING MICROWARE SUPPORT: WE KEEP IN TOUCH WITH YOU

Even when you have the best software and documentation, there can be times when you need questions answered. That's why Microware is committed to giving OS-9 users the best possible personalized service. Here are some

of the ways we deliver solid support:

- A Software Support Hotline for direct access to our technical staff
- "Pipelines", our free quarterly newsletter
- OS-9 User Seminars, the annual OS-9 community gathering
- a liberal update policy for new releases

Microware does business on a person-to-person basis. When you call you'll find yourself speaking with someone who's both knowledgeable and genuinely interested in helping.

YOU CAN COUNT ON OS-9 NOW AND IN THE FUTURE

Microware is not standing still — we're firmly committed to continuing support for the 6809 and we will continue to introduce exciting new software products for the 6809. We will soon announce OS-9/68000 and programming languages for the 68000 which will be upward compatible with 6809 versions, so if and when you are ready for the 68000 your OS-9 software can go with you.

MICROWARE.

Items Submitted for Publication

Articles submitted for publication should be accompanied by the authors full name, address, date and telephone number. It is preferred that articles be submitted on either 5 or 8 inch diskette in TSC Editor format or STYLO format. All diskettes will be returned.

The following TSC Text Processor commands ONLY should be used (due to our proportional processor): `,sp space`, `,pp paragraph`, `,fi fill` and `,nf no fill`. Also please do not format within the text with multiple spaces. The rest we will enter at time of editing.

STYLO commands are all acceptable except the `,pg page` command, we print edited text files in continuous text.

All articles submitted on diskettes should be in TSC FLEXTM format, either FLEX2 6800, or FLEX9 6809 any version.

If articles are submitted on paper they should be on white 8X11 bond or better grade paper. No hand written articles (hand written or drawn art accepted). All paper submitted articles will be photo reproduced. This requires that they be typed or produced with a dark ribbon (no blue), single spaced and type font no smaller than 'elite' or 12 pitch. Typed text should be approximately 7 inches wide (will be reduced to column width of 3 1/2 inches). Please use a dark ribbon!

All letters to the editor should also comply with the above and bear a signature. Letters of 'gripes' as well as 'praise' are solicited. We attempt to publish all letters to the editor verbatim, however, we reserve the right to reject any submission for lack of 'good taste'. We reserve the right to define what constitutes 'good taste'.

Advertising: Commercial advertisers please contact the '68 Micro Journal advertising department for current rate sheet and requirements.

Classified: All classified must be non-commercial. Maximum 20 words per classified ad. Those consisting of more than 20 words should be figured at .35 cents per word. 20 words or less \$7.50 minimum, one time, paid in advance. No classified ads accepted by telephone.

TO REALIZE THE FULL POWER & PERFORMANCE OF THE 6809, LOOK TO GIMIX.

GIMIX OFFERS YOU A VARIETY OF SS50 BUS COMPONENTS AND SYSTEMS.

OS-9 GMX III

The GMX 6809 CPU III and OS-9 GMX III. A Multi-user, Multi-tasking package for the ultimate in System Performance plus protection of the system and other users from crashes caused by errors in individual users programs.

#91 (CPU & Software) **NEW!** \$1698.01

INTELLIGENT I/O PROCESSOR BOARDS increase system throughput by reducing interrupts to the host, buffering data transfers, and data preprocessing. Prices include on board firmware. Requires system drivers.

#113 port RS232 Serial (SS30) **NEW!** \$488.11

#124 port Parallel (SS50) **NEW!** \$598.12

OS-9 GMX III drivers... (Included when purchased with GMX III package) \$200.00

OS-9 Level 2 users -- contact GIMIX for system requirements and availability.

192K GMX III 679 SYSTEMS: All include GMX 6809 CPU III and OS-9 GMX III (001); a #113 port Intelligent serial I/O & cables; #19 Classy Chassis; 192KB Static RAM, #68 DMA controller, all necessary cables, power regulators, and filter plates. The OS-9 Editor, Assembler, Debugger, BASIC-09, and RUNB are included.

#79 with dual 40 track DS00 drives **NEW!** \$5998.79

#79 with dual 80 track DS00 drives **NEW!** \$6298.79

#79 with #88 8" Dual Drive Disk System **NEW!** \$7500.79

#79 with #90 19MB Winchester subsystem & one 80 track DS00 drive **NEW!** \$2998.79

UniFLEX for the GMX 6809 CPU III and Intelligent I/O boards is in development.

OS-9 GMX I; OS-9 GMX II; FLEX; and UniFLEX

The #05 GIMIX 6809 PLUS CPU board \$578.05
Options: GMX DAT \$35.00 SWTPC DAT \$15.00
9511A \$312.00 9512 \$265.00

#49 64KB GHOST SYSTEM includes: #05 CPU; #19 Classy Chassis; 64KB static RAM; a #43 2 port serial card & cables; #68 DMA Controller; all necessary cables, power regulators, and filter plates; GMXBUG monitor; FLEX; and OS-9 GMX I. You can software select either FLEX or OS-9. The OS-9 Editor, Assembler, Debugger, BASIC-09, and RUNB are also included.

#49 with dual 40 track DS00 drives **NEW!** \$4398.49

#49 with dual 80 track DS00 drives **NEW!** \$4698.49

#49 with #88 8" Dual Drive Disk System **NEW!** \$5698.49

#49 with #90 19MB Winchester subsystem & one 80 track DS00 drive **NEW!** \$7398.49

#39 128KB SYSTEM includes: #05 CPU/NO DAT; #19 Classy Chassis; 128KB of static RAM; a #43 2 port serial card & cables; #68 DMA Controller; all necessary cables, power regulators, and filter plates; GMXBUG monitor; FLEX; and OS-9 GMX II. You can software select either FLEX or OS-9. The OS-9 Editor, Assembler, Debugger, BASIC-09, and RUNB, and GMX-VDISK for FLEX are included.

#39 with dual 40 track DS00 drives **NEW!** \$4998.39

#39 with dual 80 track DS00 drives **NEW!** \$5298.39

#39 with #88 8" Dual Drive Disk System **NEW!** \$6298.39

#39 with #90 19MB Winchester subsystem & one 80 track DS00 drive **NEW!** \$7998.39

UniFLEX, available at extra cost, requires 8" or Winchester drives. A signed license agreement with TSC is required before shipment.

You can add to any GIMIX system RAM, I/Os and other options, or substitute non-volatile RAM. GIMIX will customize to your needs.

COMING SOON: Contact GIMIX for price and availability on 40MB and 72MB Winchester (5 1/4") drives, removable pack Winchesters, 256KB static RAM boards.

All GIMIX systems are guaranteed for 2MHz operation. GIMIX systems include documentation for all boards and software in a GIMIX binder. ALL DRIVES ARE 100% TESTED AND ALIGNED BY GIMIX.

ALL BOARDS AND SYSTEMS ARE ASSEMBLED, BURNED-IN, AND TESTED. GOLD-PLATED BUS CONNECTORS ARE USED.

TO ORDER BY MAIL: SEND CHECK OR MONEY ORDER OR USE YOUR VISA OR MASTER CHARGE. Please allow 3 weeks for personal checks to clear. U.S. orders add \$5 handling if order is under \$200.00. Foreign orders add \$10 handling if order is under \$200.00. Foreign orders over \$200.00 will be shipped via Emery Air Freight COLLECT, and we will charge no handling. All orders must be prepaid in U.S. funds. Please note that foreign checks have been taking about 8 weeks for collection so we would advise wiring money, or checks drawn on a bank account in the U.S. Our bank is the Continental Illinois National Bank of Chicago, 231 S LaSalle Street, Chicago, IL 60693, account #73-32033. Visa or Master Charge also accepted.

EXPORT MODELS: ADD \$30 FOR 50% POWER SUPPLIES.

GIMIX Inc. reserves the right to change pricing, terms, and product specifications at any time without further notice.

ALL PRICES ARE F.O.B. CHICAGO

Choose from GIMIX' wide variety of system components.

The GIMIX CLASSY CHASSIS #19 consists of a heavyweight aluminum cabinet, constant voltage ferrite-resonant power supply, and SS50 Mother board with baud rate generator board \$1398.19

Microware presents 4 new OS-9 software packages.

1

LEVEL II PRINT SPOOLING SYSTEM

This versatile package gives your OS-9 Level Two System a complete print spooling management capability for time-sharing applications. Features of the spooling system are:

- Handles up to seven independent spooling devices and queues with "print on first available device" feature.
- Prints large block header pages between listings with date, time, user name and job name.
- Multiple listing copy option.
- Complete forms change capability for each job and device.
- Prints formatted or unformatted listings.
- Status command displays print queues and status.
- User can kill or change priority of queued jobs.

Available only for OS-9 Level Two Systems.

Suggested List Price: \$150.00 Manual Only: \$15.00

2

RMA RELOCATABLE MACRO ASSEMBLER

At last — a full feature relocatable macro assembler and linkage editor for OS-9. RMA permits sections of assembly language programs to be independently assembled to "relocatable object files". The linkage editor takes any number of program sections and/or library sections and combines them into a single executable OS-9 memory module. Global data (including indexed and direct addressing modes) and program references are automatically resolved in the process. The macro facility permits commonly used statement sequences to be defined, then used within the program with appropriate parameter substitution. RMA also supports conditional assembly and library source files.

Suggested List Price: \$200.00 Manual Only: \$20.00

3

OS-9 FILE HANDLER TOOLBOX

Introducing a special toolbox for OS-9 users who do a lot of file manipulation! A collection of 12 useful OS-9 command

programs: Most can be used as "filters" using OS-9 pipeline facilities. Included are:

- D** — unformatted directory listing with "wild card" matching
- Compress** — does character compression on text files.
- Expand** — restores a "compressed" file to the original state.
- Split** — breaks a file into smaller files.
- Space** — indents lines with optional spacing between lines.
- Code** — decodes any key on a keyboard to hex.
- Qsort** — quick sort for small files, directories, etc.
- Pr** — versatile formatted file printing utility.
- Tr** — transliterates text pattern to substitution pattern.
- Grep** — searches file for a pattern and prints matching lines.
- Xmode** — same "lmode" except changes are made to the device descriptor.
- Count** — counts words, lines, or characters within a text file.

Suggested List Price \$85.00

4

ENTERTAINMENT PACK 1

A collection of games and other interesting programs that are not only entertaining but serve as good instructional examples of Basic09 programming techniques. All programs include complete Basic09 source files and can be easily edited to run on standard alphanumeric or graphics terminals.

- BikBak** — A Vegas-rules blackjack game.
- Clock** — graphical display of a wall clock on your terminal.
- Dogs** — Greyhound racing with simulated graphics.
- Eliza** — Basic09 version of the famous artificial intelligence simulation of natural language dialogue with a psychiatrist.
- Haiku** — Program that creates original "haiku" prose.
- Quest** — a mini—"Adventure" game.
- Rats** — find your way out of a computer-generated maze — from a rat's point of view.
- Towers** — a graphical display of the solution to the "Tower of Hanoi" puzzle.

Suggested List Price: \$85.00

FLEX™ USER NOTES

THE 6800-6809 BOOK

By: Ronald W. Anderson

As published in 68 MICRO JOURNAL™

More help than any other thing
I have ever read, except 68 Micro
Journal, of course. Come on with
the C book on Norm Commo's column.

SWELL! - Best buy EVER in
6800/6809 book.
JTW

The publishers of 68 MICRO JOURNAL are proud to announce the publication of Ron Anderson's **FLEX USER NOTES**, in book form. This popular monthly column has been a regular feature in 68 MICRO JOURNAL SINCE 1979. It has earned the respect of thousands of 68 MICRO JOURNAL readers over the years. In fact, Ron's column has been described as the 'Bible' for 68XX users, by some of the world's leading microprocessor professionals. Now all his columns are being published, in whole, as the most needed and popular 68XX book available. Over the years Ron's column has been one of the most popular in 68 MICRO JOURNAL. And of course 68 MICRO JOURNAL is the most popular 68XX magazine published.

As a SPECIAL BONUS all the source listing in the book will be available on disk for the low price of: FLEX™ format only — 5" \$12.95 — 8" \$16.95 plus \$2.50 shipping and handling, if ordered with the book. If ordered separately the price of the disks will be: 5" \$17.95 — 8" \$19.95 plus \$2.50 shipping and handling.

Listed below are a few of the TEXT files included in the book and on diskette.

All TEXT files in the book are on the disks.

WE CAN EMULATE THIS CHIP BETTER THAN ITS MAKER.

Advanced Digital's Test Station Integrates and Debugs Your System Faster.

Introducing Advanced Digital's new 4009B Test Station. The test station that combines emulation and logic analysis into one system. Until now, most emulators operated in real-time by restraining the target system. Not with Advanced Digital. Our 4009B Test Station is totally transparent. Totally real-time. We meet or exceed manufacturer's timing specifications. This is particularly important when emulating interrupt intensive systems and accommodating DMA operation.

Universal operation enables you to emulate 6809 and 6809E series microprocessors without making software or hardware changes. Up to 128K of memory overlay, four hardware triggers and 2K deep of trace help you pinpoint problems faster. A line-by-line assembler and a

4009B TEST STATION

powerful trace disassembler are standard. They enable you to view software and make changes without returning to the development system.

MORE THAN AN EMULATOR

As a "digital engineering test station," Advanced Digital's 4009B gives you a synergistic approach to integration problems. Two microprocessors control the system. One is dedicated to emulation while the second microprocessor supervises the 32 channel logic analyzer and all system menus. This design lets you emulate and perform all system functions simultaneously.

Discover the most powerful diagnostic tool available for hardware and software integration.

Call Advanced Digital Technology for a free demonstration.

TM^P (Total Management Planning) OS-9 SOFTWARE

THESE OFF-THE-SHELF APPLICATION PACKAGES HAVE CHANGED THE PICTURE
FOR PROFESSIONAL SOFTWARE USERS

Here are the comprehensively supported OS-9 application software packages that discerning professionals are selecting today. Each one runs stand-alone or in combination with other TMP packages.

TM^P/CALC is a new-generation "Electronic Spreadsheet" package that goes a quantum leap beyond ordinary Calc software. Superior speed, and extra features like Dynamic Calculations and Dynamic Overlay, mean you can change a cell anywhere on the spreadsheet and get automatic updates wherever they belong. No more "wrap-around" since output to the printer is formatted. "Help" screens prompt without erasing data and the rows and columns on any worksheet are limited only by available memory.

ONLY \$250

TM^P/Manager is a structured database manager, and is the ultimate driving force behind any total Management/Marketing Planning system. Its built-in select/sort/merge module — and optimized machine code — makes it super-fast, and provides unusually nimble data manipulation characteristics. Other outstanding features are detailed prompting, easy identification of data fields, and an excellent security system.

ONLY \$500

TM^P FreeForm fills the void between a structured DBMS and word-processing; it's an "electronic index card" package with an endless list of valuable applications such as parts cataloging, look-up inventories and listings of any kind. Type anything on up to 32,000 electronic "cards" of up to 9 pages each that reside in "file drawers" (databases). Up to 13 key-words can call each page.

ONLY \$150

TM^P/Front-End integrates any or all of the packages described above, and integrates TM^P with word-processors, BASIC and other high-level languages. NO CHARGE with TM^P/Manager

**TM^P PACKAGES ARE
EXCEPTIONALLY FRIENDLY.
EACH COMES WITH
MULTI-MEDIA TRAINING
AND OUTSTANDING
DOCUMENTATION**

AUDIO CASSETTE TRAINING TAPES are provided with each TM^P software package. These crisp, professionally produced training aids take a new user

**RUN TM^P IN A SMOKE SIGNAL CHIEFTAIN™ COMPUTER
TO EXPERIENCE THE KIND OF SPEED AND POWER YOU
CAN EASILY AFFORD TODAY**

through "hands-on" exercises that instantly build confidence, and minimize reference to manuals.

CLEAR DOCUMENTATION is specially prepared for each TM^P package. Remarkably readable because they are conversational in style and logically organized, this series of manuals further assures quick user comfort and productivity with TM^P software. Includes sections on how to best utilize the system; integrating user-written software with TM^P packages, and other bonus topics.

VIDEOTAPE PROGRAMS are available to TM^P Dealers. They dramatically take the viewer into real business environments for a close look at how a TM^P software package is utilized. Video programs can be personalized for specific organizations. Programs may be specified for most popular tape formats.

THE BOTTOM-LINE IS THIS: Software is only as effective as its training and documentation. TM^P packages are incompatible in both areas.

Endurance-Certified Chieftains are consistently among the fastest computers in CPU and I/O speeds according to the widely respected BENCHMARK REPORTS. That, combined with almost legendary reliability, makes Chieftains the logical choice in computers using OS-9 operating systems.

Configurations range from floppy-disk systems to multi-user, multi-tasking Winchester hard disk systems with tape back-up; performance approaching mainframes at prices you can live with.

TM^P software packages for most OS-9 systems and Chieftain computers are offered exclusively from Smoke Signal. Inquiries from non-Smoke Signal dealers are invited. Call (213) 889-9340.

BUBBLE MEMORY

HIGH RELIABILITY STORAGE
FOR THE SS -50 BUS

DISK BUB provides 128K bubble memory replacing a disk drive.

- no moving parts to wear out
- direct boot capability
- withstands harsh environments such as dust, heat, vibration
- faster than standard drives
- utility software supplied

Diskbub plugs into the 30 pin I/O bus. Flex90 drivers and boot rom provided. Available for only

Taming the CT-82XX

If you have a CT-82, CT-8212, or CT-8209 terminal, you have a device with a nice green screen and lots of smart features. You also have one "feature" that is absolutely useless. There is a key on your terminal called a SHIFT LOCK. Now most terminals have what they call a CAPS LOCK. The CAPS LOCK simply causes all lower case letters to become upper case, so you can emulate an old teletype, or write a program in a language that requires upper case characters without constantly going for the shift key. Of course without caps lock you have to release the shift key for numbers and punctuation, and depress it for letters, and therein lies the problem with a SHIFT LOCK function.

Some of the software suppliers of editors have come to the rescue with a built in software CAPS LOCK. You know, if you have a CT-82XX that Stylo has such a feature. I recently received a copy of Dynastar for test and review, and I noticed that it doesn't have this feature, and so is rather hard to use with a CT-82XX. It occurs to me that there might be some other screen editors without this feature, that might benefit from some help too, so I set out to write an INCHNE (input character with no echo) routine to replace the one in SBUG-E.

It turns out that all the screen oriented editors use INCHNE so that they don't echo the control characters that you must type while editing text. I found that all calls to this routine are done by an indirect jump through the location \$D3E5. The listing of CAPS shown here is the result of my effort, and I guarantee it will work with any version of FLEX9 except the very early original FLEX09, which was a reassembly of the old 6800 FLEX, and was superceded within about 6 months. Any version of FLEX newer than about Feb. 1980 will have this jump vector.

What the routine does is to set up a CAPS FLAG, which initially is cleared so the routine doesn't modify characters from the terminal. When the routine is called, it looks for a control underline (\$1F) character, and when one is detected it "toggles" the CAPS FLAG. When the CAPS FLAG is ON, all input characters are tested to see if they are within the range of the values of a to z and if they are, they are modified to be A to Z, the upper case versions. The control underline is not passed through to the computer, so that it is lost as a possible control code to the software being run. This character could be changed to be any unused code for special applications. CAPS is assembled and then installed either by use of the GET CAPS.BIN command, or by appending it to the editor or other software so it is loaded with the software.

I decided to get a bit more general about it and to modify the INCH (with echo) routine also. CAPSALL is a listing of that attempt. I found to my chagrin that FLEX doesn't use the INCH vector it has set up (at least in General FLEX), at \$D3FB. That vector jumps to location \$D383 which does an indirect jump to the location whose address is found at \$D385, the SBUG-E entry point. Unfortunately in FLEX (GIMIX DMA VERSION) at \$CD09, the GETCHR routine, does a jump to \$D383, so it is the address at \$D385 that must be modified to cause a jump to the substitute INCH. Unfortunately the jump is indirect, so CAPSALL contains a FDB INCH, and the address of that FDB (called INCHV) is what is overlaid at \$D385. Your version of FLEX may not be the same, and this more general version that I call CAPSALL may not work without a slight modification.

I did some research on various FLEX versions, and found that the location for the overlay is always within a few bytes of \$D380, and you can look with the monitor for the double byte \$F804. This is the location that must be overlaid with the INCHV. Incidentally, all the CC FLEX versions are derived from general FLEX, and they apparently do all use the vector at \$D3FB. The CC versions, obviously don't have SBUG-E so the eventual jump is NOT to \$F804, but to some other location. You would only be interested in patching CC FLEX if you have an external CT-82XX attached to it anyway.

I put the new input routines at \$BE00, and fixed memend to point at \$BDFF so the routines won't get wiped out by any standard software that honors memend. They seem to work quite well. I can toggle CAPS LOCK off and on even while in the FLEX command mode with the ttt prompt present. FLEX ignores control characters, but all that is passed to it is a null (\$00) just to be safe. Operation of Dynastar went from nearly impossible for writing Pascal programs to being just like the operation with a different terminal or with Stylo. Stylo uses the control up-arrow to toggle its caps lock, but that conflicts with a necessary control character in another editor that I have, so I chose control underline.

It occurs to me that this sort of an input "filter" could be extended to detect other control characters and a dumb terminal could be made to look rather smart by putting the software in the computer rather than the terminal. I'd be interested to hear about anyone carrying this idea further.

68000 News

I've received a copy of a "press release" from TSC indicating that they have what looks like our familiar Extended BASIC with some enhancements, available in a 68000 version to run under the 68000 UNIX operating systems. They also announce a version of their pre-compiler for this BASIC. The description sounds just like 6809 Extended BASIC complete with sequential and random files, and virtual arrays. They have the error-trapping facilities, ERA and ERL to report error numbers and lines, and the 16.8 digit arithmetic. I don't want to imply that this is a "straight" translation. There are many enhancements such as an "approximately equal" test for floating point numbers.

I recently mentioned being asked if anyone was doing something about either Hardware or Software for the 68000. I can tell you that I have it on very good authority that GIMIX is working on a SS-50 bus version of a 68000 based system. I don't have a completion date to report, but it could well be before you read this.

EDITORIAL

Here we go again. I've been looking at the computer book section of a couple of bookstores, local and not so local, and I have some observations. There are quite a few feet of shelves full of "computer books", among which are quite a few well written books on such subjects as Pascal or "C" programming. These, however, are getting to be hard to find among the titles such as "Wordstar Simplified", "Wordstar made easy", "Understanding CP/M", "Programs in Color Computer Extended BASIC", "How to use Visicalc", and on and on seemingly endless with books EXPLAINING WHAT SHOULD BE COVERED THOROUGHLY AND UNDERSTANDABLY IN THE MATERIALS FOR THE VARIOUS SOFTWARE PRODUCTS.

The availability of so many books is a sad commentary on the "understandability factor" of much of the documentation that comes with software that is available today. These books (not necessarily actual titles) all sell for \$15 to \$20. A careful search in the local Dalton Booksellers, showed not a single book on "C" programming. There were Pascal programming books in abundance, perhaps reflecting the newness of "C". These comments apply to MUCH of what is available today, not ALL. I think in general we SS-50 bus users are lucky. Our software suppliers seem to be doing a better job than software suppliers in general.

What I was looking for, was a good textbook on computer theory. I found one in the area of "Interactive Compiler and Interpreter Design". Close to what I was looking for... How much? \$48!!! It seemed that all the textbook variety (hard cover only) ran from \$40 to \$50! While the Interactive Compiler Design was not quite what I was looking for, I'd be willing to part with \$20 for it, but \$48 seems a bit steep.

I can see it coming now. Thirty-five publishers will be bending my ear about the high cost of producing a book and how such a book has a limited market so that they have to charge that much in order to break even. It seems to me that in the age of computers, if a publisher feels the market will be limited, he doesn't need to publish a book in hardcover and typeset. What's wrong with a photo reproduced daisy wheel printout in softcover to keep the costs down? a book of this type is primarily for reference and study, and not for "show". It doesn't have to look pretty on the shelf in my library. Still, that book did say something about books on compiler design not having to be unintelligible to

someone without a degree in computer science.... Maybe I can afford it after all. Better yet, maybe I can get the company to buy it! (It did.)

WHY ME

I seem to have some strange sort of knack for finding bugs in software. I don't necessarily mean for fixing bugs, but for running across them. Way back when FLEX2 came along, TSC, after some delay, finally supplied a rework of Uiterwyk's BASIC for it. Of course I had a "backlog" of old programs in BASIC, and I tried running them. About the third program, I had a problem. After some experimenting I found that the RESTORE statement didn't work with a DATA statement. Perhaps someone thought that with disk files no one would use DATA statements any longer. Of course my old game program had one, and it bombed. TSC was quick to provide a new copy without that problem, as have most all of the software suppliers in general.

Somewhere around what must be pushing a year ago now, I received a new compiler to evaluate. To the chagrin of the supplier (a VERY conscientious one), I continued to find peculiarities for several months and versions as I got into applications and translating some older programs from Pascal. The supplier indicated that he had been selling the product for over a year, and that I was the ONLY user reporting bugs. We wondered together whether the others just didn't happen to be using the features that had the bugs, or didn't bother reporting them. I (and all the other owners of the compiler) received very prompt patches where possible and new versions when a patch wasn't feasible. A couple months ago (about 6 by the time you read this) I received a "final release" version with a very large and well done manual. I have found no bugs since. The supplier was Windrush, and the product PL9.

I could mention several other cases of immediate finding of bugs in new software. In nearly every case, the response from the supplier has been one of surprise and immediate correction. The moral of the story is that if you do find a bug you should report it immediately. You will be HELPING the supplier by pointing out the problem so it can be fixed before he sells another 50 copies and then has to update those additional 50 owners of the software.

I've said it before, but it bears repeating, that you should be sure you have found a bug, and that you are not misinterpreting the instructions. A supplier will pay attention if you can reduce the program that shows up the bug to its simplest form. A test program of a dozen lines that shows up a bug is much more valued by the supplier than 10 pages with a vague description of the problem.

OmegaSoft

In the September '83 issue of this magazine, Don Williams published a letter from me concerning an oversight on my part. I had been rather wrapped up in comparisons of various compilers, and had done a test on several compilers to look at the code they generated for some assignment statements involving simple variables and array elements. OmegaSoft didn't fare so well against a couple of the newer compilers. Bob Reimiller of OmegaSoft phoned me to tell me that I must have used his version 1 of Pascal, and that the newer version was much more efficient in the area of code generation. The comparisons in question were in the July issue of '83. I've rerun the tests. If you have the July issue handy, refer to page 12. In the second column, just above the result table, I had given the byte count for the compiler in the last and most complex expression. OmegaSoft is shown as generating 62 bytes. Version 2.1 generated 39 in my test, right in there with the best. The table shows OmegaSoft as having generated 376 bytes for the whole set of assignments. The newer version generated 220 bytes, and OmegaSoft Pascal since version 2.0 has had BYTE variables, which were used in the test.

Since that issue I have done some timing comparisons using the BYTE magazine Sieve of Erastosthenes Benchmark program. I had reported OmegaSoft Pascal as running that sieve in 20 seconds on a 2 MHz system. My tests with version 2.1 indicate the time to be 14 seconds. Bob Reimiller reports results more on the order of 12 seconds. Perhaps some rearrangement of the variable declarations would put the most referenced ones where the referencing instructions would be shorter, and I don't doubt Bob's results. The authors of the article in BYTE did allow taking advantage of specific features of a compiler including order of declaration of variables, declaring them local or global, etc.

Introl

The other day I received a nice letter from Introl Corp. In that July test report, I had mentioned having used Introl "C" integer only version on a friend's system to run the test. I reported that short integer and integer were the same in Introl "C". I didn't mention that the K&R specification says that is OK. What I didn't see at the time was that I could just as well have used variables of type char for the cases in which bytes would be adequate. I've rerun the tests for that also. The total byte count using integers and chars for the 16 and 8 bit data types respectively, yielded a byte count of 227 rather than the 261 indicated in the July article.

Introl's president also pointed out to me that I had coded the sieve benchmark test algorithm incorrectly in my review of Whimsical in the September issue. One look was all it took to convince me of the truth of that. I will have to plead a "stupidiy attack" here, as I did in my reply to Introl. Of course the array must be reinitialized for each of the ten iterations. It was initialized only the first iteration in my coding. I've re-coded the test and rerun it. The results were 11.5 seconds for ten iterations on a 2 MHz system. The listing is included here. Obviously, I have to retract my statement that these are the fastest results to date with any compiler I have tested. The correct algorithm yields time that puts the execution time in line with PL9's and just below the Windrush, Dyna-C, and Introl "C" compilers.

I'm sorry for the inaccuracies. I've written about the problems with the previous reports, but it seems that I didn't do a whole lot better with my tests. Still, though, I could make the point that we have five compilers that run the Sieve Benchmark in from 10 to 11.5 seconds. Three of those have floating point capability and two have integer only. Three of them are "C" compilers, which must say something for the language and the implementation available.

PROCESSORS

I also received a letter recently from Gary Bergstrom in Ohio. He noted my comments about our 2 MHz 6809 being compared to a 4 or 6 MHz Z-80. I'll quote his letter here: "Be careful about clock speed discussions. I believe a 6 MHz Z-80 can use slower memory than a 2 MHz 6809 (8 MHz crystal). An 8 MHz Z-80 requires slightly faster memory than a 2 MHz 6809. Zilog and Intel talk crystal frequency and Motorola and the 6502 crews talk crystal frequency / 4. Memory access (or bus bandwidth) is a fair comparison (or at least fairer). Compare 4 MHz Z-80's with 1 MHz 6809's and 2 MHz 6809's to 6 or 8 MHz Z-80's... and remember, I like the 6809's but fair is fair."

Gary makes a very good point. Anyone else have any comments? I know that the basic "machine cycle" for the 6809 takes place at 1/4 of the crystal frequency. Someone write and tell us if this is also true for the Z-80. Actually since that column, I have reported some more current benchmark timings and added some late compiler implementations, and the results are still very favorable to the 6809.

Well, I'm sorry for the rather fragmented column this time. There were just a lot of little things to report, and I had to give reply time to those who were kind enough to write and set me straight where I had made some errors.

OS9 USER NOTES

By: Peter Dibble
517 Goler House
Rochester, NY 14620

As I was working away, distracted by the problem of choosing a topic for this month's column, I deleted a bunch of files by mistake. Worse, I didn't notice that I had done myself in until minutes later -- too late to get the files back. This event made the choice of a subject for this month substantially easier. The first topic for this month is file security.

Users on OS-9 are known by a number. If you use OS-9 as it came off the distribution disk you

will be the only user and have the user number 0. User 0 is special: UNIX users would call him the superuser. The superuser has special privileges that enable him to circumvent the protection of files. All other users, and, to some extent the superuser, are separated from disk files by OS-9's file protection scheme.

If you use the DIR command with the "E" option: OS9: DIR E you will get a list of the files in your current working directory with a lot of information about each file:

directory of . 19:50:32	Owner	Last modified	attributes	sector	bytecount	
name	-----	-----	-----	-----	-----	
Column4	1	83/05/10	2234	-----wr	CD	4141
Column8	1	83/09/11	2351	-s--r-wr	AF	45BD
Column5	1	83/06/11	1630	-----r	84	6081
PROGRAMS	0	83/09/14	2036	d-ewrwr	BD	3E0
Dictionary	1	83/08/28	1614	----r-wr	245	8E9

The information in this display that relates to a file's protection are its owner and attributes. All the files in this directory, except the file (a directory file) called PROGRAMS, belong to user number 1. The type of protection given to a file depends on the contents of the attributes field.

The first position in the attributes field is for the directory attribute. Directory files have several special characteristics, the one relating to protection is that they can't be deleted with the DEL command.

The second position in the attribute field is the shareable attribute. If there is an "s" in this position, the file can only be accessed by one process at a time.

The next six positions in the attribute field are two groups of three attributes each: public execute, write and read, and private execute write and read. If a public attribute is on (indicated by a letter instead of dash in that position) then any user can do that class of operations. If a private attribute is on, the owner of the file can do that class of operation.

The file called Column4 has typical protection. User 1, who is the owner of the file, can read or write it, and nobody else can do anything to it except observe that it is there.

Column8 is protected such that any user can read the file, but only user 1 can write to it. It also has the non-shareable attribute which protects it against being accessed by more than one user at a time. The non-shareable attribute prevents things from getting confusing when user 1 is updating the file and some other user is reading it, by preventing that situation from coming about. Whoever gets to the file first has exclusive access to it until he closes it. If several users want to read a file at the same time there is usually no reason not to let them do so, problems start to appear when a user wants to write to the file while other access it, and things get really sticky if several users want to update the file at the same time. The non-shareable attribute is most important when several users want write to a file concurrently.

The protection of column5 demonstrates one of the more useful applications of file protection in a

single user system. It is impossible for anyone, even the owner of the file, to write to it without first changing its attributes. Since the class of operations controlled by write protection includes writing, renaming, and deleting, a file which is write protected can't be deleted by mistake. If I had write protected my files I wouldn't have been able to delete them without thinking about it.

It would appear to be impossible to ever delete a write protected file, but the owner of the file can use the attr command to change the attributes. The procedure for deleting a write protected file is: use the attr command to remove the write protection:

OS9: attr column5 w Then delete the file with the normal del command.

None of the data files in this directory have the execute attribute. They are all text files and manifestly not executable. OS-9 will only load a file for execution if it has the executable attribute. The separation of the execute attribute from the read attribute makes it possible to create an execute-only file. It would be difficult for someone to copy, dump, or disassemble an execute-only file. The execute-only attribute is a useful trick for protecting proprietary software.

A particularly sneaky problem is related to the execute attribute. Merging executable files together to form a file with all the modules used by some program, or to allow a set of popular utilities to be loaded compactly under Level Two, will create a file which doesn't have the execute attribute. OS-9 won't let you execute or load the resulting file. It gives an error 214, "NO PERMISSION." The fix for this problem is to use the ATTR command to give the file the executable attribute.

If you don't intend to have more than one user on your computer there is no reason for you to worry about user numbers. If you want to share your computer with other people -- either taking turns using the computer or using OS-9 as a multi-user operating system -- it is a good idea to have a separate user number for each person who uses the computer. The best way to set your user number is to start the TSMON process in the startup file. The last line in the startup file should be something like:

TSMON /TERM TSMON will just sit there until you type a carriage return. This may give you the impression that something is wrong with the computer unless you are ready for this stolid lack of activity. To comfort myself I include the line:

ECHO Press carriage return to initiate logon>/TERM
before the TSMON command in the startup file. It leaves directions on the screen after I boot the system. If you are lucky enough to own a system large enough to support three terminals, the following sequence of commands could be included in the startup file to get everything going:

```
Echo Press carriage return to initiate logon
>/TERM
Echo Press carriage return to initiate logon
>/IT1
Echo Press carriage return to initiate logon
>/IT2
TSMON /IT1&
TSMON /IT2&
TSMON /TERM
```

It is important to start the last TSMON as a foreground task (no &).

The main business of TSMON is done by the LOGIN command. The LOGIN command uses files called password and mtd which must be in the SYS directory

on the same disk the default data directory is on (normally /00). The password file includes the user-name, user-number, and, optionally, a password for each user authorized to use the computer. It also includes a lot of information used to set up the environment for each user. The full contents of each line in the password file are:

```
User Name
Password
User Number
Initial priority
Initial execution directory (usually .)
Initial data directory (usually .)
Initial program to execute (usually "shell")
```

The login command prompts for a user-name, and, if that user has a password in the password file, for a password. If the user-name isn't in the password file, or the password isn't correct, LOGIN announces the mistake and prompts for user name again.

The login command protects each user number from unauthorized use by insisting on getting a good user-name/password match before letting someone use a user-number. Many different users can share a user-number, allowing them to share files in a group, but each user-name can only be associated with one user number.

If you find a need to change your user number in the middle of a session with your computer you may be able do it with the LOGIN command. The LOGIN command can only be used if your default data directory is on the same disk the password file is on. The LOGIN command needs to read the password file. If you protect the password file against public read to keep everyone from browsing through the passwords, nobody but the superuser can use the LOGIN command.

The mtd file contains the "message of the day." If there is any text in mtd it will be displayed on the screen each time anyone logs on. It can be used to display a general greeting, or to give system status information of general interest; e.g., "We are running a new release of Pascal today."

Some tricks can be done with the "Initial program" in the password file. It is possible to specify not only the initial program, but also a parameter string for it. This opens up extensive possibilities. Most operating systems allow a user to have the commands in a file (sometimes called a user profile or a login command file) executed every time he logs on. If you are willing to accept some limitations, the initial command can be used to do much more than start a shell for you when you log on.

The simplest possible entry in the password file might go something like:

```
myname,,3,100,,,shell
```

which would set up a user called myname. Myname would have a user number of 3, and would be started with a priority of 100. His data and execution directories would be standard -- for most systems /00 and /00/CNDS. Whenever myname logs in a shell will be started for him.

A somewhat more demanding user can make the password file do much more for him. The following line in the password file sets up a user with a password of xyzzy, gives him non-standard data and execution directories, and runs FREE and MFREE for him before leaving him running a shell:

```
hisname,xyzzy,2,150,/00/HISDIR,/00/BASICX,
                                         shell free;mfree;ex shell
```

I had to split the line after the execution directory in order to fit it into a column. In the password file it must all be on one line. The important thing is that the sequence of commands the

user wants executed must start with the name of the program that will interpret the rest of the line. If that program is the shell, the last command in that shell's parameter string must be an ex for whatever command you want to start the user with.

If you want to start a user with a particularly long script of commands, perhaps enough commands to hold him for an entire session, use a shell command file. The trick is to have the initial command be "shell" with a file name as the parameter. If the file isn't in the default data directory its full path-name must be specified. A sample password file entry might go like:

```
hername,wltrs,5,130,,,shell her.cmd.file ; ex shell
```

In this case the file "her.cmd.file" must be in the system default data directory. The command file invoked at login is just like any other shell command file. The important restriction to remember is that the shell command file is run by a different shell from the one that the user will be using when the command file is finished. If you change the directories in the command file, those changes will effect only the shell running the commands, not the shell that will be running after the command file is done.

The "Suspend State"

Microware has added a nifty performance enhancement to the latest version of OS-9. They discovered that device drivers were spending a significant amount of time using the F\$SEND service request (SR) to communicate between the interrupt service routine for the port and the rest of the device driver. In order to understand why the send was done you need some background in the way the OS-9 SCF device drivers work. The simplest way to write a device driver is to read and write to the port directly from the read and write entries of the driver, but this requires that the driver go into a wait loop while the interface chip is performing the operation. A wait loop isn't a bad thing if the processor has nothing to do until the I/O is complete, but, in an environment like OS-9, there are likely to be several tasks waiting to get done. The "right" way to write a device driver under OS-9 is to have the actual I/O done by an interrupt service routine, and have the read and write entries of the device driver share queues with the interrupt routine.

A character to be written goes to the write entry of the device driver which puts the character into the write queue if there is space for it, or goes to sleep if there isn't. The interface chip should be set to generate an interrupt whenever it is ready to write another character. The interrupt service routine will be started every time an interrupt is received from the port it is responsible for. If the interrupt was an output interrupt, the interrupt service routine will take a character out of the output queue and send it to the port. If the device driver is sleeping, waiting for an empty slot in the queue to appear, the interrupt service routine should send it a wakeup signal.

The procedure for reading a character is roughly the reverse of that for writing. The queue for input goes from the interrupt routine to the read entry and the device driver sleeps if a read is done when the queue is empty.

All this sending from the interrupt service routine to the driver is expensive. A new system state called the "Suspend State" was invented to keep device drivers from having to use F\$SEND requests to start and stop its read and write

operations. The "suspend state" is a lot like a light nap. The process is in the grey area between sleep and activity. Suspended processes remain in the active process queue where they quickly age to the top of the queue, but while the suspend bit is on in their process descriptor they can't be scheduled. To wake a suspended process up just turn the suspend bit off in its process descriptor. The following code would wake a suspended process from the interrupt routine of a driver:

```
Idx (Address of process descriptor
      for the process you want to awaken)
    Ida 255-Suspend
    anda P$State,X
    sta P$State,X This sequence of instructions can
be done a great deal faster than a F$SEND.
```

A process can suspend itself by turning the suspend bit in its process descriptor on, then sleeping for a tick. The sleep is just a way of giving up the rest of the time slice. Even without the F\$Sleep, next time the dispatcher sees the suspended process descriptor it will treat it as suspended, and won't start it again until the suspend bit is turned off.

There are a few important limitations to the suspend state. The first is that a process can't get out of suspend state on its own. The second limitation is that the suspend bit is in the process descriptor which is in the system address space. A non-system process has no easy way of directly modifying the process descriptor. The last limitation is implicit in the advantage of suspend state, suspended processes stay in the active process queue. They will slow the dispatcher down slightly because it will have to pass over them each time it looks for the next process to run.

COBOL is the version of the language you may have used on a mainframe computer, but it does mean that if you don't use the enhancements that CIS COBOL includes, the programs you write using it will run essentially unmodified on any other computer that runs level 2 or higher of ANSI COBOL. Also, since CIS COBOL is compiled to intermediate code, programs written in it can be run on any computer that has the appropriate interpreter. If you read the adds in BYTE, you will see that CIS COBOL is implemented for many computers.

I didn't test CIS COBOL exhaustively for conformance to the standard, but I did write a few programs in it. I am used to IBM's VS-COBOL, and a version of UNIVAC COBOL; both are highly enhanced versions of higher levels of ANSI COBOL than CIS COBOL. It took me a while to learn which of my favorite programming tricks aren't possible under level 1 of ANSI COBOL, but, after I learned the limitations I had to live with, I found that I could write programs with no more difficulty than I usually experience when writing in COBOL. I wish I had been able to transfer a program from the IBM to my micro and compile it, but I don't know of any real programs written to be compiled by ANSI level 1 COBOL. Transferring a program in the other direction is no problem.

There is far too much to CIS COBOL for me to say with certainty that it all works, but I understand that the language has actually been successfully tested against a set of standard test programs.

Enhancements

Standard COBOL doesn't support the interactive microcomputer environment very well, but CIS COBOL includes enhancements to the ACCEPT and DISPLAY statements that make it relatively easy to display screens of data, and accept data from fields defined on the screen. Information can be accepted from, or displayed at, a particular cursor location. An input field can be defined as numeric only, in which case any inappropriate characters (like "A") won't be accepted. When a field is filled with data, the cursor automatically jumps to the beginning of the next field. There are special keys which jump the cursor forward and backward a field at a time. Special function keys can be defined. They act like a carriage return (terminate entry into a screen), but a program can determine whether a screen was terminated by a carriage return or a function key, and which function key was used. The location of the cursor when carriage return was pressed is also available. The net effect of these enhancements is that it is fairly easy to write CIS COBOL programs that accept and display screens of data.

In addition to the usual COBOL file organizations (including ISAM), CIS COBOL allows an organization they call "line sequential." Line sequential files are variable length record files, in which the records are terminated by carriage returns. This makes it easy to read and write files that Pascal would call "files of text." The most generally important examples of files of this type are files created by text editors, and line by line output to a terminal or printer. The other access modes supported by CIS COBOL are: sequential, relative, and indexed.

The names of files can be specified at run time using statements like:

```
SELECT FILE-15 ASSIGN TO FILE-15-NAME.
...
ACCEPT FILE-15-NAME.
OPEN INPUT FILE-15.
```

In addition to the standard ANSI debug features, CIS COBOL has a respectable interactive debugger. The commands available under this debugger are:

P - Display the current program counter
G - Set a breakpoint
X - Single step
D - Display data at specified offset in data division
A - Change memory (ASCII)
S - Set block for display or change
/ - Display block
* - Change bytes in block
T - Trace paragraphs
L - Write CR,LF
M - Define a debug macro
\$ - End a macro definition
C - Display a specified character
; - precedes a comment (for describing macros)

The interactive debugger can be used on any COBOL program by including +D on the command line that invokes the program, e.g., RunC +D test.int. This means that you can use the debugger on a program without having to do anything special when you compile it.

Microware has included eight subroutines in the COBOL run time system which can be called from a COBOL program. MOVE-BLOCK is a procedure that can be used to do a high speed move of a block of data. ABORT terminates the program with an error code. CHAIN makes the standard OS-9 F\$Chain system call available. The FUN-KEY subroutine can be used after a ACCEPT statement to find out if a function key was pressed instead of the carriage return key, and which one. DATE returns the date and, optionally, the time. SHELL invokes a shell, passing it a specified string. CHX and CHD change the execution and data directories for the program.

The subroutines in the run time system are called by number. CIS COBOL can also call subroutines which are either COBOL I-code, or object code. The CALL statement looks like:

CALL "/D0/SUBLIB/TEST.SUB.1" USING ...

ON OVERFLOW The called program is loaded into memory if it is not already there, and, depending on whether the module header indicates that it is I-code or object code, interpreted or executed. If there is no room in memory for the new module, the ON OVERFLOW clause in the CALL statement gets control. The CANCEL verb unlinks a subroutine, freeing the memory it is using.

In addition to these methods of calling external subroutines, CIS COBOL supports program segmentation, which can be used to divide the program into sections that will remain on disk until they are needed. Segments use memory efficiently at the cost of extra disk I/O by sharing a common pool of overlay memory.

In addition to supporting ANSI COBOL level 1, including:

The Nucleus
Table Handling
Sequential Input and Output
Relative Input and Output
Indexed Input and Output
Segmentation
Library (Copy)
Inter-program communication
debug CIS COBOL supports parts of level 2 of ANSI COBOL including:
Nested IF
PERFORM UNTIL
The START statement for Relative and Indexed I/O and full level 2 Inter-program communication

Limitations

I was disappointed with some of the restrictions of the low level of COBOL implemented for CIS COBOL, but not very surprised. I am more upset by some problems with terminal support, and the CONFIG utility that is used to customize the run time package for a particular type of terminal.

The features of advanced levels of COBOL that I missed most were AND and OR in IF statements. It is possible to do without boolean operations in IF statements, but I am not used to having to work around a limitation like that. Another very popular feature which is missing in CIS COBOL is the SORT statement. A surprising number of production COBOL programs include at least one sort, and it would be hard to eliminate a sort from a program without a major redesign.

The run time system which interprets the COBOL intermediate code also includes routines for terminal control. It is customized for a terminal by a utility program called CONFIG. I was not impressed with CONFIG. My favorite terminal uses the ANSI standard terminal control sequences ... CONFIG was clearly not written with my terminal in mind. I struggled for two evenings trying to get RunC configured for my TeleVideo with no success. Finally, I gave up and turned to my H-19, which was much more like what CONFIG wanted ... I had COBOL running in ten minutes. There were three fundamental problems with CONFIG's handling of my TeleVideo's control sequences. CONFIG expected most terminal control strings to be no more than three characters long; several of the ANSI strings are longer than that. CONFIG simply can't deal with the ANSI direct cursor positioning sequences; I circumvented that problem by pretending that my terminal didn't have a direct cursor positioning command, and specifying relative positioning. CONFIG can only deal with commands that move the cursor one row or column at a time in relative positioning mode. Since the ANSI strings that cause the cursor to move one row or column are three characters long, this is a slow way to adjust the cursor position. The clear-screen sequence for my terminal is four characters long; so I couldn't use it. RunC tries to fake a clear-screen somehow, but it makes a real mess of it. The clear-screen sequence somehow came out as a string of thousands of <bell> characters. I understand that a more recent version of CONFIG than the one I have allows a four character string for the clear-screen sequence. I think that would have made it possible for me to get my TeleVideo working with COBOL.

CONFIG forms a trap for the unwary user. Once you start into it there is no turning back. If you change your mind about the response you just keyed in, you have to wait until you reach the end of the entire (long) string of questions, and ask to be allowed to change a large subset of your answers. When you are going through CONFIG to fix a mistake or change an existing terminal description to fit a new terminal, you have to fill in the correct answer to each question. There is no way to select a default, or keep the old value. It is true that CONFIG is not likely to be a heavily used utility, but I found it so hard to use that I would much rather have written a few subroutines to support my terminals.

Once I got the screen support working, I found that I wasn't pleased with the way it worked. I believe that when the cursor leaves a numeric field, the field should be right justified and zero filled. The screen handling package in CIS COBOL seems to agree with me to some extent. If you enter a "." in an integer field it will right justify and zero fill, but if you exit the field with a carriage return (ending the entire screen) or down arrow

(moving to the next field), a test for numeric in the program will indicate that the field is not numeric. If the field has editing characters in it the field is inclined to end up left justified and zero filled.

I am used to getting useful, english error messages from COBOL; CIS COBOL gives error messages with numeric codes in them indicating what the error is. Even after I looked up the error, it wasn't clear what the problem was. For instance, when I hadn't declared a variable it told me that there was a type mismatch in the statement using the undeclared variable. When I tried to use AND and OR, it gave me the same error. I ended up treating the error message as "something's wrong around here."

Benchmarks

I ran two benchmarks against this COBOL: one for speed at numeric processing (the sieve), the other for speed in handling ISAM files. I adjusted the prime number program from the January 1983 BYTE slightly to fit ANSI level one, and ran it. This version of COBOL would have fallen nearly at the bottom of the chart given in that BYTE, between Microsoft COBOL and RMOOBOL. It took 541 seconds to find the first 1899 primes. I could have made the program run somewhat faster by using indexing instead of subscripting, but that would have spoiled the benchmark. I have to admit that I felt silly writing a Eratosthenes Sieve program in COBOL. Testing COBOL for its ability to find prime numbers is like testing programmers for their ability to read Latin; they may be able to do it but it is hardly relevant. I ran that benchmark because it is the most used benchmark for microcomputer languages, but I also ran another non-standard, but, I think, more relevant, benchmark.

I constructed a benchmark program which gives a good measure of the speed with which the language handles indexed I/O. Indexed I/O is very important to the group of users who might use COBOL. Interpreting the results of a benchmark that involves I/O is a little tricky. Certainly the file structure the language uses is very important, especially with a large indexed file; but the access time for the disk is an important factor, and the time the operating system takes for a context switch is somewhat important.

I built a file 10,000 records long of 55 byte records with five byte keys and then read it randomly reading two records alternately from each end. It took 2615 seconds to build the file and 3233 seconds to read the file (it would, of course, have been possible to read it faster if I had read sequentially). I ran these benchmarks on a GIMIX system with a CM 5000 Winchester (a file that size would not have fit on my 8" floppies). I used OS-9 Level Two on a 2 mhz 6809. The performance would have been much worse if I had used a floppy instead of a Winchester, and somewhat better if I had used GMX-11.

I compiled three COBOL programs on the same machine I ran the benchmarks on. A simple merge program which I haven't included with this review took 45 seconds to compile, the sieve compiled in 35 seconds, and the ISAM test program took 43 seconds.

Summary

It is possible to get past the problems with CONFIG, to learn to live with the primitive error messages, and to feel comfortable with the screen handling conventions. What is left is a substantial implementation of an old, but useful language.

I don't think everyone should run out and buy this package, but, for a few people, it could be uniquely useful. If you want to use a group of COBOL programs on microcomputer, it would certainly be easier to convert them from one level of COBOL to another than to translate them into an entirely different language. CIS COBOL would be a good teaching tool for schools unable to afford time on a machine with a full-blown COBOL compiler. It should be relatively easy to find programmers who can work in COBOL. With CIS COBOL, a microcomputer could be used as a development environment for COBOL programs, though the low level of CIS COBOL would prevent this in most cases. Perhaps the most significant advantage of CIS COBOL over other languages is that programs written in CIS COBOL can be moved in I-Code form to a variety of other machines and operating systems, and run without source code. UCSD Pascal has shown that this is an asset even though it can't generally run under a normal operating system.

CIS COBOL was written by Micro Focus Limited. Microware wrote a run time package for it that allows any program written in CIS COBOL, including CIS COBOL itself, to be run under OS-9. By writing a run time package for CIS COBOL, and arranging to license it for OS-9, Microware made a large collection of business software available to OS-9 users. If you are looking for a nice accounting system, payroll, MRP system, or whatever, check with Microware. They have a long list of vendors offering programs which run under the CIS COBOL run time system.

Some small number of people will find Microware's version of CIS COBOL just what they need. If you think you are one of those people, I recommend that you get the manual before you commit to the language. The manuals won't be any help to you if you don't know COBOL, but, if you do, they will leave you with an accurate impression of the language, and either leave you impatient to get the software, or disappointed about some important missing feature (most likely sort).

"C" User Notes

Norm Coromo
3 Pryor Road
Natick, MA 01760

As promised last month, we will have look at the Dyna-C compiler; also, some hints on using command line arguments and, since I have gotten some letters about the subject, some of the different ways you can play around with arrays and pointers.

DYNA-C COMPILER

I finally got some time to investigate the OS-9 version of the Dyna-C compiler and, so far, have liked what I've found. The compiler is a Small-C variant for the 6809 based on Ron Cain's original article; which is freely acknowledged in the introduction of the manual.

The whole file package fits onto a single 5.25" diskette and includes

- manual
- Dc the compiler (DC-CMD for FLEX)
- chead.a a standard runtime support header
- stdio.h the standard I/O header file
- stdio.a the assembler I/O file
- extio.c extended I/O functions and string operators
- ctype.h an assembler file containing such functions as toupper(), tolower() and such
- primes.c

The manual is quite well done. The organization and neat layout make for easy, comprehensive reading. After a brief introduction and description of the distribution disk, it launches right into how to compile programs. Next comes the Dyna-C language definition. This section details the differences between Dyna-C and the full implementation. There is a section on the standard library, running separate compilations and compiler internals. The last section is summary of Dyna-C syntax.

I've said it so often that this will probably sound like a broken record. The manual does not attempt to give a tutorial on the language. But it does provide adequate documentation to understand and use the compiler.

The compiler is a pretty good subset for a "small" compiler. It would probably be shorter to say what it doesn't have, but safer to tell you what it does have. Here's a partial description of its features

data types

int, char

declarations

type - int or char,
pointer to type - *type,
array of type - type[],
array of pointer to type - *type[],
pointer to pointer - **type,
pointer to array of pointers - ***type[]
etc...

constants

decimal, octal, hex, character, string

escaped characters

The usual complement with one exception; \n the newline character is really <cr>. If you want <lf> then you must use \010.

operators

The operators include just about the full span of unary, binary, assignment and logical operators. Two that are missing are the >>= and <<= assignments. On the other hand, the conditional assignment operator ?: is included.

control structures

if-then-else
while
do while
for
switch
break
continue
goto

directives

#include
#define
#ifdef-#ifndef-#endif
#base-#endbase

As you can see, it's a pretty complete set that should allow you to go quite far. In general, system type programming before the compiler starts to limit you in any severe way.

Compiling a program is pretty straight forward. If the whole program exists in one file then you can get by with the commands (for OS-9)

```
Do [options] sourcefile asmfile [sourcefile2]...  
Asm asmfile o=objectfile #20k
```

The first line would actually compile the input files and produce an output file. If no assembler file name is given, then the output goes to the terminal. In which case you could only compile one file since the second source file would be considered the assembler file. The next command just assembles the file. The #20k is an OS-9 parameter that tells the operating system how much data memory to allocate to the process.

There isn't anything magic about the 20k. The number was taken right from the example in the manual. I tried one compilation of a reasonably sized program (about 6 or 7 pages of C source code) without specifying any additional memory and the assembler ran out of symbol table. Using 20k allowed the program to assemble without a hitch.

There are only two or three switches (options) for the compiler, depending on the operating system. These are

-s	Include the C source code as assembler comments.
-pxx	Indicates that this module is not the "main" module so that internal compiler labels will start with the prefix xx.
-nName	(OS-9 only) assign Name as the module name. The default is Cprog, or any name specified in the #module directive.

The -pxx is a really nice way to handle multiple modules when you can't use a linker. Most Small-C compilers allow you to specify the starting number nnnn for each module of the program. This could get touchy when there are a number of modules. You have to start with increments big enough to avoid duplicate labels. It is also a VERY sticky problem when you to build up decent libraries.

Dyna-C clears away most of the problem by letting you pick the prefix instead. Even avoiding the use of "cc" which is the default, still leaves LOTS of different combinations. In fact, it may often be possible to pick to letters that are mnemonically meaningful to the file. This could make generating and maintaining libraries easier. Kudos to DynaSoft for a clever idea on that one.

Where I personally differ with DynaSoft is how they include standard support functions. To me the organization of the standard library seems chaotic. For example, fopen(), fclose(), read() and write() are in chead.a. Getchar(), getc(), putchar(), and putc() are in stdio.a; which gets called from stdio.h. The file extio.c has the functions printf(), fputs(), gets(), fgets(), fputs(), strcat(), strcpy(), strlen(), and atoi(). Finally, ctype.h includes most of the is...() and to...() functions which are written in assembler between #asm and #endasm directives.

A more convenient approach might be to make the entire library "stand alone" assembler sources with a finer granulation of functions within files, according to their use. A potential reorganization might be

chead.a	All necessary run time set up and the terminal primitives getchar(), gets(), putchar() and puts().
extio.a	File I/O such as fopen(), fclose(), getc(), fgets(), putc(), read(), write(), and fputs().
char.a	The character test functions is...() and to...().
string.a	The basic string functions such as strcat(), atoi(), strlen() etc.
printf.a	The formatted I/O routines such as printf(), fprintf() etc.

I realize that there may be coupling between many of the functions that would render such an arbitrary

grouping impractical. But there are advantages to doing it this way. The two most important would be that the inclusion of the library can be made independent of any C source modules and that it will occur at assembly time, not at compile time. This could result in significant time and code size savings. What would then be required is an assembler file that contains nothing more than a bunch of INCLUDE or LIB statement that pull in all the necessary modules and libraries. This should sound familiar; I have mentioned it for other Small-C compilers as well.

Note that the sources for much of the library could be supplied to the user as C code, who could then modify them to suit the needs at hand.

This approach is not without its own disadvantages of course. Careful attention must be paid to the assembler file that contains all the INCLUDE's to insure that all the necessary modules are brought in. Adding a new module would require updating that file. It might also require a more thought when transporting programs from other environments, such as UNIX.

For example. Under UNIX, the ls...() and to...() character test functions are really macro's contained in the file ctype.h (I rather suspect that this is the reason Dyna-C has them as assembler code the the same file). If you had implemented a library along my suggestions, you would certainly have to do some editing in order to compile the program. Oh well, there goes the free lunch!

Getting back on the track. When I received the package I also got some of Dynasoft's proprietary utilities to try on the compiler. I have compiled and run these programs as well as the old standby primes.c.

The compilation and assembler process by and large went smoothly and without a hitch. I did have to slightly modify one C program by changing the order of two #includes to avoid one error, but that was all.

The programs seemed to work smoothly, which I expected since they are in use at Dynasoft all the time. Examination of the code produced by the compiler showed it to be tight and well structured. Primes ran in 29.5 seconds on my 1Mhz system. That's pretty quick. In fact, I believe that it's the fastest time I've seen from a Small-C compiler for this coding of the primes program. And that includes the 4Mhz Z80's as well. Come to think of it, at 2Mhz (equivalent to a 4Mhz Z80) the program should run in a little under 15 seconds. That even beats most of the big compilers for the Z80 according to the benchmarks published in BYTE magazine last year.

Based on the programs I've compiled and the code I've looked at I would rate this as a very desirable package for the C neophyte. You can get your feet wet without a lot of expense and still do a lot of very serious programming before needing a full compiler.

COMMAND LINE ARGUMENTS, ARRAYS AND POINTERS

I have received a few letters that requested some more details on pointers, arrays and strings. Some of you have also wanted some hints on using command line arguments. Since command line arguments are strings, which in turn are accessed as arrays, or with pointers, let's kill two birds with one stone. We'll look at strings, pointers and arrays by using command line arguments.

The processing of command line arguments is really a function of both the operating system and the particular compiler that you are using. All the 6809 compilers on the market today have some sort of argument handling as part of the runtime support code.

The minimum handling consists of converting all the arguments (of the command line that invoked the program) into valid, NULL terminated C arrays of characters, or strings. This can happen in a number of ways. The compiler could first copy the whole line into another buffer or do the conversion with the line still contained in the operating system's command line buffer. Where it actually happens is really irrelevant to the program.

Three things happen as each argument on the line is processed. First, an argument count (initialized at zero) is incremented. Then a pointer to the first character of the argument is put into an array of pointers. Finally, the end of the argument is found and the character following it is changed to a NULL, thereby terminating the string.

After the command line is parsed main() is called with two parameters on the stack, the count of the arguments and the address of the first pointer (of the array of pointers).

Let's assume we are running a program under FLEX where the runtime code parses the line in FLEX's command line buffer, which starts at \$C080. Suppose that the command line is

++cprog arg1 arg2 arg3

For convenience, let's put a ruler under the line to count off the characters in the buffer. The ruler will be calibrated in Hex to make life easier.

cprog arg1 arg2 arg3
-----+-----+
0 8 10

By a convention established with the UNIX operating system, the first argument is the program name. So the argument count starts at 1. Let's also assume that the program is building the array of pointers in memory at \$4000.

The parser would start scanning the command line from \$C080 looking for the first argument. In this case it would encounter 'c' at \$C080. It would then increment the arg count to 1; put address \$C080 into locations \$4000 and \$4001; then scan for and change the terminator following CPROG into a NULL. Since the terminator was not a <cr>, it would continue scanning until it came across arg1. It would then repeat all the previous steps. This process would continue until the end of the line terminator <cr> was encountered.

The final argument count would be 4. If we stopped the program at this point and did an EXAMINE of \$4000 from SBUG, the first 8 bytes would look like

\$4000 C0 80 C0 86 C0 8B C0 90

These are the pointers to each argument on the line.

The argument count, 4, and a pointer to the first element of the array, \$4000, are put on the stack just prior to calling the user's program. Note that it is the address of the pointer array that is put on the stack and not the address of the command line.

To get access to these arguments you must declare main as

```
main(argc, argv)
  int argc; /* the argument count */
  char *argv[]; /* the pointer array */
```

There is nothing sacred about using the names argc and argv for the variables. This is also a convention carried over from C programs developed on the UNIX system. You can name them anything you want, it has nothing to do with the language.

Understanding the declaration for argv may not be obvious to the casual or beginning user so let's decipher it. This is done by starting at the variable's name and working outward.

There is a variable named argv. The name is enclosed by * and [].

The [] is a primary expression operator and has the highest binding priority. Another way of saying that you attach it to the name first.

argv[]
an array (of something)

The * could either be the multiply operator or Indirection operator. Since this is a declaration, it must be the latter. We now have

*argv[]
an array -- of pointers (to something)

Finally, we are left with char. So we end up with

char *argv[];
an array -- of pointers -- to chars

Another, synonymous, declaration form for argv would be

```
char **argv;  
a pointer -- to a pointer -- to chars
```

It may take you a while to accept these as being equivalent, but the compiler treats them that way.

Ok, so how do we use all this stuff in a program? Consider the case where a program expects to find a list of one or more file names to process and possibly an option or two. For purposes of the following discussion assume the previous declaration for main(); repeated here for clarity.

```
main(argc, argv)  
int argc;  
char *argv[1];  
{  
...  
}
```

Since the program needs at least one file name to process, calling the program with no arguments is an error. We can handle this condition with

```
if (argc < 2)  
{  
    printf("no filenames");  
    exit();  
}
```

If argc is 2 or larger, then we have one or more arguments. Now we must check whether any particular argument is an option or a filename. This could be done with a simple for loop.

```
for (i = 1; i < argc; i++)  
    if (*argv[i] == '-')  
        set_option(argv[i]);  
    else process_file(argv[i]);
```

Note two things here. The array is an array of pointers. To look at what an array element points to use the form

```
*argv[i]
```

To pass the pointer to a function we just need to pass the actual value of an array element with

```
argv[i]
```

If there was only one option, named x then we might want to test for it right in the loop, in which case the code could be

```
for (i = 1; i < argc; i++)  
    if (*argv[i] == '-')  
        if (**++argv[i] == 'x')  
            do_something();  
        else  
            {  
                printf("unknown option");  
                exit();  
            }  
    else process_file(argv[i]);
```

This starts to get a little more complex. Once there is an option, we must look at the second character to determine if it is x. The easiest way to do this is to preincrement the pointer past the '-' and test the next character. This is done in

```
**++argv[i].
```

We know that [i] binds the tightest, but will we increment argv[i], or what it points to. Since * and ++ have the same binding lever, but associate from right to

left, the rightmost symbol binds first. So we are incrementing argv[i] and then using it as a pointer. If you had not been sure then you could have parenthesized it as

```
*(++argv[i])
```

I tend to parenthesis often since it is very clear both to me and to the compiler what I really want. You can really get carried away with this. Suppose that what is pointed to will be incremented and then the pointer will be incremented. This yields

```
++*++argv[i]
```

Then to add to the confusion, you might also want to preincrement the index which gives

```
++*++argv[+i]
```

Timeout! Enough is enough. The eye-brain system starts to overload on this one. It's cute and the compiler should have no problem interpreting it. But would you really want to try to understand a program sprinkled with these kind of bombs through it? If the statement becomes too complex break it into pieces.

If you had a pointer to an array it would, by definition, point to the zeroeth (first) element. In the C compilers that we have for the 6809, an array is never passed as a whole entity. Instead we either pass the value or the address of a particular element. To pass the value of element 4 of the array 'value' we would use

```
do_something(value[4]);
```

But to pass its address we would use

```
do_something(&value[4]);
```

It just so happens that, as a convenience, we can refer to the address of the first element of an array by the array name itself. Assume a program has a buffer declared as

```
char user_input[50];
```

The buffer is to be passed to some function that will do something to the line. The code could be

```
act_on_buffer(user_input);
```

This would be exactly the same as

```
act_on_line(&user_input[0]);
```

There are some other ways in which pointers and arrays may be intermixed in use. Generally, it is more efficient to use pointers than arrays since there is less address computation.

Consider the following simple function.

```
process(s)  
char s;  
{  
    while (*s)  
        switch (*s++)  
        {  
            case 'a' : action1();  
            break;  
  
            case 'b' : action2();  
            break;  
  
            case 'c' : action3();  
            break;  
  
            case 'd' : if (s[-2] == 'a')  
                        action4();  
                    else  
                        action5();  
                    break;  
            default : action6();  
        }  
}
```

Process() has only one argument, *s*, which is a pointer to char. The function scans the character string and does some kind of action depending on what character is found. For efficiency, *s* is incremented directly each time through the loop after its value has been taken by the switch statement. There is a unique action for all characters except 'd', which was two possible actions. What action gets taken depends on the character that preceded 'd'. Rather than actually manipulate the pointer and then have to restore it, the function just looks backward with the negative index. In this case, since the pointer has been incremented past the 'd', it is necessary to use -2 instead of -1.

This function is a poor example in that it makes the assumption that a 'd' will never occur as the first character of the line, otherwise it would memory that preceded the first element of the string. However, it does at least bring out the fact that we can use a negative index. Note that *s* was declared as

```
char *s;  
but we turned around and used  
s[-2]
```

This is possible because the compiler looks at the declarations

```
char *s and char s[];  
synonymously. Maybe it's clearer to think of the second declaration as being another way of saying "s is a pointer to char".
```

You should also get comfortable with the fact that, given an array called 'an array', then accessing the 5th element of the array can be done with either *an array[5]*; or *(an array + 5)*;

To understand why think of it this way. The intent of either statement is to look at element 5. So in both cases, the compiler will multiply 5 by the size of an array's data type, expressed in bytes. If the data type was char, then nothing would be done. If the data type was int, then the offset is multiplied by two.

Being able to refer to an object as an array or with via a pointer is quite handy. But like all good things it can be abused. A computer scientist might find this lack of strong typing detrimental, but a programmer will find it timesaving.

IT'S A WRAP

That's it for this column. I hope that it has helped shed some more light on array and pointers. I don't have the next column nailed down, but I will try to finish up a couple utilities and get at least one of them into print. Tell them...

SELECTRIC 6800 DRIVERS

Marc I. Leavey, M.D.
WA3AJR
4006 Winlee Road
Randallstown, Maryland
21133

Add A Selectric Printer To Your 6800

One of the early realizations I had while setting up my computer for business use was that the ASR-33 just would not make it as a printer. I mean, for program listings, OK, but could you see my editor's face if I sent in a manuscript prepared on it? That kind of "tsoris" I

don't need. A friend had a dot-matrix printer which I borrowed for a while. It was fast, but hardly the quality I had hoped for.

Thus it was with quite some joy that I acquired a Selectric printer, with "serial" interfacing. Only problem was that try as I might, no print would come out when I hooked it up to an ACIA port on my 6800 based computer. Some research provided the answer. This Selectric, as many others, uses Correspondence code, not ASCII. Not only is the code itself different, but the baud rate is an oddball (for most computers) 134.5 baud. Hoo boy!

I recalled seeing an ad for an ASCII board for the printer on hand, a Trendata 1000 (identical to the Datatrans 1000). Scrounging through some old issues of Kilobaud, I found it. An assembled ASCII to Correspondence code converter, designed for the Trendata, only \$250! Two-hundred and fifty dollars? There has got to be a cheaper way.

Well, of course, there is. Why would I write an article if all you had to do was plunk down a quarter-thou to be on ASCII? Besides, the way I ended up, not only can you switch type elements (golf balls), but the printer even has some smarts, with form feeds and variable length pages. Interested? Read on.

You see, old issues of Kilobaud Microcomputing, 73, and who knows, maybe even Byte, do have value. For while I was rooting around looking for that old ad I came across an article in the November, 1979, issue of Kilobaud Microcomputing which described an ASCII to Selectric driver for an 8080 based system. While not directly applicable, it started me thinking, and I examined the author's encoding technique carefully. After some tinkering, both with hardware and software, I came upon a workable scheme. A few modifications later, a very nice printer was up and running.

As the author of the 1979 article pointed out, the scheme used by IBM in the six bit Correspondence code is analogous to the common Teletype(R) five-level Baudot code, in that two character sets are used, with up-shift and down-shift commands. In my 73 Magazine column, RTTY Loop, I outlined a scheme for the 6800 which performed the translating of Baudot to ASCII back in July, 1978. Changing the

timing loops and code table quickly produced the skeleton of a working system.

The code table is organized much as the one in the 8080 article. If you have access to a Selectric manual, one was purchased with my printer and is an invaluable asset, you will find that each character requires six data bits, a parity bit, and start and stop bits. The table is organized so that shifting the bits out of the byte retrieved from the right (LSB) side results in transmission in the correct order. This produces a code table in which the data is in reverse order, on a bit-by-bit basis within each byte, from the standard IBM code. Also, the leftmost bit of each byte is used as a case bit, with "1" stored for lower case and "0" for upper case.

Of course, most of the characters easily sort into upper or lower case. There are three, however, in which case does not matter, at least with the "standard" type ball. These are the space, period, and comma, all of which are represented in both upper and lower case. Rather than have the machine jump back and forth to change cases when encountering one of these characters, I included a bit of logic to bypass the shift change if one of these three characters was to be printed.

Another problem was that of carriage returns. Not to decode line feeds was obvious. The Selectric has no mechanism for performing a carriage return without a line feed, and since essentially all of the software habitually sends a line feed after a carriage return, having the decoder software ignore the line feed neatly solves one problem. Additionally, the printer must pause when returning, or else the next character will end up smeared across the page as the typing element flies back to the left margin. Although a set of contacts is available inside the printer to send a signal when the carrier is set at the left margin, interfacing them was felt to be more difficult than providing a simple short delay. Thus a software delay was incorporated in order to provide the pause that refreshes after a carriage return.

Tabbing? Sure, why not. The standard ASCII TAB character, control-I, hex \$09, is decoded to the Selectric TAB character. Send a tab out, tab a tab over. What could be simpler?

As noted in the earlier article, several codes are decoded by the Selectric to place the machine on and off line. Since the turn-on code is the number nine, setting the machine up once it is running will cause an extraneous "9" to be printed. I therefore included the turn off code in the table, decoded as the equivalent to ASCII control-S (for Stop), and send this first in the initialization, followed by the turn on character. Thus, if the machine is on line, it is turned off before being turned on again. If it is already off, it, of course, ignores anything until the turn-on code is sent.

Finally, the need for some more intelligence was obvious. So, logic was added to enable the printer driver to keep track of the current line number in a page, and, upon receipt of a Form Feed (control-L or \$0C) automatically advance to the first line of the next page. In order to set up the number of lines, an ESCAPE sequence is sent to the printer. Upon receipt of an ESC code (\$1B), the program takes the next byte as the page length, and sets the current line counter to zero. If the character following the ESC is \$01, however, the page length is not changed, only the line pointer is restored to zero.

When first implemented, the form feed worked well, but, because it used carriage returns to run down the page, it was a bit slow. I then allowed the ASCII vertical tab character (control-K, \$0B) to be decoded as the Selectric INDEX character, really a line feed. This allowed the rapid feeding of lines and significantly improved the driver's function.

Other characters that were not represented on the type ball I first used were either assigned as a null or space, as the fancy struck me. At least this allowed me the facility for writing in those omitted characters on drafts requiring one or two of them.

After a while, it became apparent that several of the ASCII character set, most notably the greater and less than signs, were fairly indispensable for BASIC listings and the like. I even liked to use them as attention getters on bills and such. A short search (checking through my office supplier's catalog) turned up the Manifold type ball, which seemed to be just what I needed. This ball has only upper case, but includes most of the ASCII

signs, with a few more thrown in for good measure. Figure 1 is a chart comparing the two balls, in QWERTY order.

It took only a short while to modify the driver program to accomodate the new ball. The checks for period and comma were removed, there is a case difference on the Manifold sphere. And since the Manifold ball has only upper case characters, although they type in lower case positions, the code table was duplicated to output the same code for either ASCII upper or lower case letters.

In order to interface the new driver routines, which I assembled in the \$B000 block of memory, to my DOS, several new addresses are inserted into the DOS jump table. Smoke Signal's DOS68 systems include this jump table to tell DOS where everything is. It is a simple matter to give it the addresses of the new initialization and output routines. Once this is done, any program which uses the DOS printer driver addresses will output through the Selectric. Thus, the editor, assembler, or text processor all work with the new system.

The many BASIC interpreters available make it difficult to predict how to interface any particular one. However, most of the Smoke Signal BASICs have a I/O table at the beginning. I patched in the driver addresses as shown in Figure 2, leaving the character input routine tied to my keyboard, which is a PIA on Port 4. Thus, even with the printer selected, should control somehow be transferred there, as with a PORT statement, keyboard input will be maintained. Otherwise, once the printer was assigned as the control port, there would be no way to input data, and the computer would have to be reset to regain control.

At the end of the source listing is a short routine that loads into the transient command area (TCA) of DOS which does several things. First, it begins initialization of the output PIA, which is later finished by the standard initialization routine at \$B000. It also prints a banner to tell me which type ball I have selected and what the current page length is. These may not be necessary, I called the two routines GOTHIIC.SEL and MNIFLD.SEL so which type ball I get is obvious, but it is nice to know what the

computer is doing once in a while.

I was initially afraid at how much kludging I would have to do to get the PIA to drive the RS-232 link. Guess what I found out? The old MP-LA PIA card, with buffers and all, drives the Selectric link directly just fine, accounting for the fact that writing a "1" to the port, which I think of as a mark, drives the port high, which is RS-232 space, and vice versa. So take the programming on the cuff and save some hardware.

How many things can be this simple? A software driver for a Selectric printer that neatly interfaces to DOS and all other major programs. Hardware involved is zip, and the software even adds a few features that the "ASCII Selectrics" don't have. Now, if only a modem was this easy.

HEAD CLEAN - KEY LOCK

The following two programs are being submitted for public use. The first one is for cleaning the heads of 5" drives. It is to be used with one of the cleaning disks on the market. The second program, written by a friend of mine, is very useful if you have small children or animals around the house that like to hit keys on the terminal while you are away from the computer, say to answer the phone or the door. It will lock up the computer until you enter the correct code. It's also useful to include in a

startup routine so the system can't finish booting until it gets the right code. It can also be used with any program that allows you to send commands to Flex such as Basic.

I have been getting Micro 68 since Volume 1, Issue 1 and I treat them like gold. They are invaluable as a reference source that I use at least once a week. Keep up the good work!

Joseph Aulicino
2014 - 59 th Street
Bklyn, N.Y. 11204

P.S. The Flex9.equ file contains all Flex equates used with the LIB function of the assembler.

PL/9 - A BASIC COMPARED

Comparison of Windrush PL/9 and Microware A/BASIC for Dedicated Software Development on the MC6809

by E. W. (Bud) Pass, Ph.D.
Computer Systems Consultants, Inc.
1454 Letta Lane, Conyers GA 30207
Telephone Number 404-483-1717/4570

INTRODUCTION

PL/9 and A/BASIC are programming systems designed primarily for dedicated, special purpose, applications which would normally be developed using assembler language.

The PL/9 system is composed of the following three parts, which are coresident in memory during program development.

a line editor,
a compiler,
a symbolic debugger.

The A/BASIC system is composed of only a compiler.

This article compares PL/9 and A/BASIC in terms of their use in such applications as dedicated development in which speed and size are more important factors than language compatibility and ease of development, although these factors are always desirable. The discussion will concentrate on the PL/9 compiler language itself, mentioning the PL/9 editor and debugger only briefly.

LANGUAGE COMPARISONS

GENERAL

The PL/9 language is a not-very-high-level language, more similar to "C" than it is to BASIC. WINDRUSH claims that PL/9 is a high-level language, similar to PL/M or PASCAL; however, it has no string nor input/output constructs and cannot therefore be logically classified as a high-level language. It supports

ARITHMETIC EXPRESSIONS

PL/9 evaluates arithmetic expressions in a left to right fashion, without regard to operator precedence, unlike most other languages. This trait may cause major problems for those already familiar with BASIC. However, PL/9 honors parentheses to force other orders of evaluation. PL/9 supports the following operators in top to bottom (but not left to right) hierarchical order:

1. (,)
2. functions, unary -, pointer .
3. *, /, +, -, AND, XOR, OR, =, <, >, <=, >=, <=, >=, =

PL/9 provides the pre-defined constants TRUE and FALSE and variables ACCA, ACCB, ACCD, CCR, and MEM for the convenience of the user. TRUE has value of -1 and FALSE has value of 0. ACCA, ACCB, ACCD, and CCR represent the 6809 A, B, D, and CC registers, respectively. MEM is a BYTE array based at zero, with size 65536, so all of memory may be addressed directly as if it were an array.

A/BASIC evaluates arithmetic expressions with regard to operator precedence, as is common with most other languages. It supports the following operators in top to bottom (but not left to right) hierarchical order:

1. (,)
2. functions
3. *, -, +, /
4. <, >, =, <=, >=, <=, >=, =

INPUT/OUTPUT

A/BASIC has syntactical elements defining access to the terminal and disk files, along with the scanners and number converters required to get data in and out of the program to those devices. PL/9 has no syntactical elements defining input/output to any devices, nor does it have the support functions to support the number conversion. Thus, A/BASIC input/output will be substantially easier to use for those applications involving terminal and disk files. However, for other applications, both languages have constructs which support direct access to memory and the calling of external and internal machine language routines to assist in the support of other devices.

Both A/BASIC and PL/9 support the GEN statement, which allows the direct insertion of machine language into the program. PL/9 requires that GEN statements be grouped into ASMPROCs, which are otherwise similar in declaration to PROCEDURES. In an ASMPROC, it is not necessary to name the parameters, the declaration of local variables is not allowed, and the type of the ASMPROC, if any, must be explicitly stated following a colon following the parameter list, if any.

A/BASIC allows GEN statements at any point which any other statement may appear. PL/9 GEN statements generate one byte per entry, whereas A/BASIC GEN statements generate two bytes per entry if the constant value is greater than 255 and one byte otherwise. The PL/9 companion assembler, MACE, separately available from Windrush, has an option which allows it to generate the ASMPROC declarations and GEN statements from assembler language input.

PL/9 supplies the MEM array automatically. It is a BYTE array of 65536 elements, representing all of memory. Thus any location in the address space may be inspected and modified. A similar array could be declared in A/BASIC by the user, or the A/BASIC PEEK function or POKE statement could be used for similar purposes.

Both languages also support the declaration of variables at named specific addresses in memory, and this could be used to logically inspect and modify those locations. For example, a PIA at \$E030 could be pointed to in an A/BASIC program as follows:

```
BASE=$E030
DIM PIAn(4)
```

and the same PIA could be pointed to in a PL/9 program as follows:

```
AT $E030: BYTE PIA(4)
```

Then PIAn(n) and PIAn(n) would access the n-th internal PIA register, where n has a value of 0, 1, 2, or 3.

Neither language has an absolute advantage over the other in terms of supporting special devices, although A/BASIC has a decided advantage over PL/9 in terms of support for terminal and disk access, at least when generating code to run under control of an operating system such as PLEX or OS/9.

DEBUGGING AIDS

The A/BASIC compiler provides the normal careful checking of the syntax of an A/BASIC program provided by most other BASIC compilers. However, it does not provide the careful run-time checking of the execution of an A/BASIC program which users of many BASIC interpreters have come to expect, nor does it provide such debugging aids as line or variable traces or the setting of breakpoints at specified lines. The usual method of modifying a program to assist in debugging it is to add PRINT statements to indicate the values of critical variables at critical points.

The PL/9 system consists of the PL/9 compiler, a line editor, and a symbolic debugger, all of which are co-resident in memory simultaneously. The generated object program may be placed into memory by the compiler for immediate debugging or execution or on disk for later execution. The editor may be used to create or modify PL/9 or other programs and data files. PL/9 programs may be checked for syntax and certain run-time errors and easily corrected, without leaving the PL/9 system. The compiler saves the names and locations of the variables and inserts calls to the symbolic debugger in the PL/9 program when it is invoked with the symbolic debugger option. Then, when the program is executed under control of the symbolic debugger, it can be single-stepped, breakpoints, traced, and its variables may be printed by name. The debugging code is not inserted into the PL/9 library portion of the program, only into the user portion of the program. It cannot catch all classes of errors, and some, such as invalid subscripts, may crash the entire system; nevertheless, it is very useful as a debugging tool.

SUMMARY

This article has compared the Windrush PL/9 and Microware A/BASIC systems in terms of development of dedicated systems. The PL/9 system has the advantages of supporting a structured language and having a co-resident editor and symbolic debugger. The A/BASIC system has the advantage of supporting terminal and disk files and string manipulation within the syntax of the language.

PL/9 is available from Windrush Micro Systems for \$198.00, and MACE is available for \$98.00. A/BASIC is available from Frank Hogg Laboratory for \$150.00.

APPENDIX I: SYNTAX AND SEMANTICS CHARTS

The following tables present the syntax and semantics for each of the languages A/BASIC and PL/9. The tables are divided into functions, operators, and statements. The following notation is used in the tables:

b	byte expression
B	byte constant
s	numeric or string expression
L	list of variables and string variables
n	numeric expression
N	numeric constant
S	statement
a\$	string expression
S\$	string constant
v	variable
w\$	string variable
x	numeric or Boolean expression
[]	optional
...	repeated

The first column classifies the syntactic token on the line. The second column contains the name of the function, operator, or statement. The third column contains the parameters of the function, operator, or statement. The next one or more lines contain the semantics associated with each function, operator, or statement.

A/BASIC SYNTAX AND SEMANTICS

TYPE	NAME	PARAMETERS	SEMANTICS
function	ABS	(n)	absolute value of n
function	ASC	(a\$)	numeric value of first character of a\$
function	BUPS		I/O buffer
function	CHR\$	(n)	ASCII character corresponding to n
function	EOP	(#n)	test file n for end of file condition
function	EZR		error number
function	FILSIZ	(#n)	number of sectors in file n
function	LEPTS	(a\$,n)	string representing n characters starting at left of a\$
function	LEN	(a\$)	length in bytes of a\$
function	MIDS	(a\$,n1,n2)	string representing n2 (or remaining) characters starting at n1 characters into a\$
function	PEEK	(n)	8-bit numeric value at address n
function	POS		character position in print buffer
function	RIGHTS	(a\$,n)	string representing n characters at the end of a\$
function	RND	([n])	random number between 0 and 32767
function	STATUS	(#n)	status of file n
function	STR\$	(n)	string conversion of numeric n
function	SUBSTR	(a\$,a\$)	first occurrence of a\$ in a\$ (or zero if not found)
function	SWAP	(n)	swapped bytes of 16-bit value n

function TAB	(n)	advance print buffer pointer to position n	statement CLOSE	n[, \$n,...]	load and run BASIC program named \$S
function TRNS	(s\$)	argument s\$ without trailing spaces	statement CLOSE	FILEs	close specified files n1, n2, ...
function VAL	(s\$)	numeric conversion of string s\$	statement CREATE	n, s\$	close all files
operator		binary logical inclusive or (l r)	statement DIM	v[n,n][,...]	create file n with name s\$
operator =	s\$"	unary string constant definition	statement DIM	v\$[n,n][,...]	declare dimensioned variables
operator #		unary logical negation (!r)	statement DIM	v[n,n][,...]	declare string variables with length n1 or string arrays of dimension n1.
operator \$		unary hexadecimal constant definition	statement DISPLAY	[s[,][e[,]][,...]]	length n2
operator %		binary logical exclusive or (l%r)	statement DISPLAY		output strings and control characters to terminal
operator &		binary logical and (l&r)	statement END		terminate execution
operator (unary expression group start	statement EXPAND		expand memory space
operator (unary file number group start	statement FOR	v TO n [STEP n]	create loop with control variable v
operator)		unary expression group end	statement FOR	set initially to n1, terminal condition of v crossing n2, step size n3 (or 1)	of v crossing n2, step size n3 (or 1)
operator *		binary numeric multiply (l*r)	statement GEN	N,[M,...]	insert specified values into program
operator +		binary numeric addition (l+r), binary string concatenation (l\$+r\$), unary numeric positive (+r)	statement GOSUB	N	call subroutine starting at line N
operator ,		binary subscript separator, binary parameter separator, binary PRINT punctuation (tab), unary PRINT punctuation (CRLF)	statement GOTO	N	branch to line N
operator -		binary numeric subtraction (l-r), unary numeric negation (-r)	statement IF	= GOSUB N	call subroutine starting at line N if expression x true
operator /		binary numeric division (l/r)	statement IF	= THEN N	branch to line N if expression x true
operator :		binary separate statements on line	statement IF	= THEN S [ELSE E]	perform statement S1 if expression x true; otherwise perform statement S2
operator <		binary PRINT punctuation (no tab), unary PRINT punctuation (no CRLF)	statement INPUT	L	input list L from terminal
operator ==		binary numeric less (l<r), binary string less (l\$<r\$)	statement KILL	s\$	delete file named s\$
operator !=		binary numeric not greater (l<=r), binary string not greater (l\$<=r\$)	statement [LET]	BUFS=s\$	replace contents of I/O buffer with string expression to right of equal
operator <=		binary numeric equal (l=r), binary string equal (l\$=r\$)	statement [LET]	v\$[n]=s\$	assign expression on right of equal to variable on left
operator >=		binary numeric not greater (l>=r), binary string not greater (l\$>=r\$)	statement [LET]	v[(n,n)]=n	assign expression on right of equal to variable on left
operator <>		binary numeric not equal (l>r), binary string not equal (l\$>r\$)	statement NAME	s\$	set module name to s\$
operator =		binary numeric equal (l=r), binary string equal (l\$=r\$)	statement NEXT	v	initiate next iteration for FOR loop with control variable v
operator ==		binary numeric assignment (l=r), binary string assignment (l\$=r\$)	statement ON	ERROR GOTO [N]	set trap at line N for error handling or terminate error handling trap
operator !=		binary numeric not greater (l>=r), binary string not greater (l\$>=r\$)	statement ON	NOVR GOTO N	branch to line N if no overflow
operator <=		binary numeric not less (l<=r), binary string not less (l\$<=r\$)	statement ON	OVR GOTO N	branch to line N if overflow
operator >		binary numeric greater (l>r), binary string greater (l\$>r\$)	statement ON	n GOSUB N,[N,...]	call subroutine at n-th line number N
operator >=		binary numeric not less (l>=r), binary string not less (l\$>=r\$)	statement ON	n GOTO N,[N,...]	branch to n-th line number N
statement *	...	introduce remark (column 1)	statement OPEN	n,n,\$	open file n1 with name s\$
statement	introduce remark (column 1)	statement OPT	L	provide compile options
statement BASE	(-n)	set ram assignment address to n.	statement ORG	[=]n	set program address to n
statement CALL	n	call machine language subroutine at address n	statement PAG		continue compiler listing on next page
statement CHAIN	s\$	branch to label v	statement POKE	(n[,n]	store 8-bit value n2 at address n1
statement IF	x THEN S [ELSE E]	perform statement S1 if expression x true; otherwise perform statement S2	statement PRINT	[e[,][e[,]][,...]]	output characters to terminal
statement INCLUDE	s\$	compile file s\$ as part of PL/9 program	statement READ	fn,L	read data into list L from sequential file n
statement JUMP	N	branch to machine language subroutine at address N	statement REM		introduce remark
statement ORIGIN	=N	set program assignment address to N	statement RESTORE	n1,n2,...]	rewind files n1, n2, ... and reopen for input
statement PROCEDURE	...	introduce PL/9 subroutine	statement RETURN		return from most recent active GOSUB
statement v[n]=	n	assign expression on right of equal to variable on left	statement RREAD	fn,n,L	read data into list L from random file n1 record n2
statement REPEAT	B FOREVER	repeat statement B endlessly	statement RWRITE	fn,n,L	write data from list L into random file n1 record n2
statement REPEAT	B UNTIL z	repeat statement B until z is true	statement SCRATCH	fn[,n,...]	rewind files n1, n2, ... and reopen for output
statement RETURN	[n]	terminate execution of PROCEDURE and optionally returns value and type represented by n	statement SHELL	s\$	pass message s\$ to operating system
statement STACK	=N	set stack assignment address to N	statement STACK	[=]n	set initial stack pointer to address n
statement STACK	=*	set stack assignment address to	statement STOP		terminate program execution
			statement WRITE	fn,L	write data from list L into sequential file n

PL/9 SYNTAX AND SEMANTICS		
T PE	NAME	PARAMETERS SEMANTICS
function	ACCA	contents of A register
function	ACCB	contents of B register
function	ACCD	contents of D register
function	B TE (n)	byte equivalent of integer n
function	CCR	contents of CC register
function	EXTEND (n)	lab of n sign-extended to first byte
function	INTEGER (b)	integer equivalent of byte b
function	MEM (n)	contents of address n
function	NOT (n)	one's-complement of n
function	SWAP (n)	swapped bytes of 16-bit value n
operator	' B	unary byte constant definition
operator	(unary expression group start
operator)	unary expression group end
operator	*	binary multiply (l*r)
operator	+	binary addition (l+r), unary positive (+r)
operator	-	binary subtraction (l-r), unary negation (-r)
operator	*	unary pointer to v
operator	/	binary division (l/r)
operator	:	binary separate declarations
operator	;	binary separate statements
operator	<	binary less (l<r)
operator	<=	binary not greater (l<=r)
operator	>	binary not equal (l>r)
operator	=	binary equal (l=r)
operator	>=	binary greater (l>=r)
operator	>=	binary not less (l>=r)
statement	/* */	introduce remark
statement	ACCA =n	set contents of A register to n
statement	ACCB =n	set contents of B register to n
statement	ACCD =n	set contents of D register to n
statement	ASMPROC	introduces machine language PROCEDURE
statement	AT N:	set variable assignment address to N
statement	BEGIN [S:[S;{...}]] END	group statements into one unit
statement	BREAK	terminate WHILE or REPEAT statement
statement	CALL N	call machine language subroutine at address N
statement	CCR =n	set contents of CC register to n
statement	CONSTANT v=N[,v=N,...]	introduce list of constants
statement	END	terminate statement group started with BEGIN
statement	ENDPROC [n]	end PROCEDURE and optionally returns value and type represented by n
statement	GEN N[,N,...]	insert specified values into program
statement	GLOBAL ...	introduce declaration of global variables
statement	GOTO v	
statement	WHILE x S	current program assignment address while x is true repeat statement S

APPENDIX 2: A/BASIC AND PL/9 EXAMPLES

Following are two examples representing (almost) the same algorithm programmed in each of the languages A/BASIC and PL/9.

MICROWARE BREAKS GROUND FOR NEW FACILITY

Saturday October 9, 1982 is a date that will go down in 6209 microprocessor history. The staff of Microware held an informal ground breaking ceremony to mark the beginning of a new era for the company.

A 7500 square foot building, designed with special software development labs, demonstration areas and business offices is now under construction in Des Moines, Iowa, with a planned occupancy of March, 1984.

The first shovel of dirt was dug by Ken Kaplan, President of Microware, to usher in the coming of age of the company. The programming staff took the honors of the second shovel followed by the marketing staff. Invited guests included members of the banking and real estate community of Des Moines who assisted in the planning and financing.

This marks a landmark in the history of Microware. The growth of the company has been on the up and up over the last two years and this building is the proof that we intend to keep up the momentum of bigger and better things." Ken Kaplan stated as the champagne glasses were lifted.

PRODUCT ANNOUNCEMENT
Effective October 1, 1983

XDMS V1.1 and XDMS+

XDMS V1.1 is the first major revision to the XDMS Data Management System. This version incorporates several enhancements designed to add processing flexibility within the GENERATE process control statements. For example, it is now possible to do rate table lookups (e.g. tax, FICA, etc) on ranges of values and incorporate the found values in subsequent calculations. Immediate commands have been added to permit in-process file deletes or purge, terminal messages and prompts, and optional escape from the process. GENERATE error handling is now non-fatal, allowing interactive users to correct or reenter instructions without reloading the program. XDMS V1.1 replaces V1.0 effective October 1, and is available for \$179.95. Upgrades for registered XDMS V1.0 users is \$25.00.

XDMS+ adds to V1.1 a set of useful utilities. SET permits display or change of the XDMS margin, width, page, ejects, backspace, end-of-line, delete, return echo, escape, reprint, null count, pause, backup, work drive and date values. PLOT produces horizontal bar, symbol or time charts. COPYDEF defines new files with existing formats. REVISE permits modification of file field definitions. OUTPUT dumps a .DMS file in tabular ASCII format. INPUT loads a .DMS file from dump output or user generated text. FORM displays the print form of a .DMS file. SIZE lists the number of file records and sectors. PURGE erases the data portion of a .DMS file. FILES displays a file name matrix for a given file extent. More to be added.

XDMS+ is available for \$249.95. Registered XDMS V1.0 users may upgrade to XDMS+ for \$50.00. Shipping on all orders is \$2.50 domestic, \$7.50 foreign. Orders may be placed with Southeast Media on 800-338-6800.

NEWS

MORE INFORMATION:
WILLIAM SCHLOSSER
Marketing Manager

Huntsville, Alabama. **UNIVERSAL DATA SYSTEMS**, (Huntsville, AL), a subsidiary of Motorola, Inc. (Information Systems Group), now offers high-speed, over-the-phone-line computer communications at a very competitive price. The Universal Data Systems model UDS 212LP 1200 baud modem is available for \$649 (suggested U.S. retail) at participating Universal Data Systems dealers.

The high speed of the UDS 212LP means less demand on computer time, lower line charges and other economies. This applies to use in communications between computers, dial-up information services, time-sharing systems, computer bulletin boards and BBSs.

The UDS 212LP has taken advantage of advances in engineering technology to greatly reduce its power requirements. Since it is powered entirely by the telephone line itself, the need for bulky, heat-producing power supplies or modules is eliminated. The result is a sleek, low-profile unit that rests comfortably under a telephone.

Universal Data Systems is located at 5000 Bradford Drive, Huntsville, Alabama, 35803. Telephone (205) 837-8100.

TECHNICAL SPECIFICATIONS: UDS 212LP

The UDS 212LP offers 1200 bps differentially coherent phase shift keyed (PSK) communications under Bell 212 protocol. It is intended for use over two-site direct-distance dial (BDS) public switched telephone networks.

Controls and indicators: A talk/data switch controls whether a telephone or modem is connected to the telephone line and an originate/answer switch, which selects the appropriate data exchange operating mode. A front panel light indicates when the modem is off-hook.

Dimensions: 6-1/8 in. W by 9-1/2 in. D by 1-1/8 in. H.

Weight: 15 oz.

UDS modem functions are available in circuit-card form for OEM applications; UDS produces more integral modem cards for the data communications market than any other manufacturer — more than a half million modems during the past ten years.

Modems manufactured by Universal Data Systems are warranted to perform as specified for an entire year, assuming proper application and no physical or electrical abuse. During that period, UDS will repair or replace any modem that suffers a malfunction.

UNIFLEXTM BASIC 68000 PRECOMPILER

FOR IMMEDIATE RELEASE

FOR THE UNIXTM OPERATING SYSTEMS

Chapel Hill, Technical Systems Consultants, Inc., has announced the availability of the UNIFLEXTM BASIC 68000 precompiler for the UNIXTM Operating Systems. Available for OEM licensing, the UNIFLEXTM BASIC 68000 precompiler is designed to accept an expanded, improved syntax of BASIC source code and converts, or precompiles, the source to a standard syntax acceptable to the UNIFLEXTM BASIC 68000 interpreter. Perhaps the most useful feature of the UNIFLEXTM BASIC 68000 precompiler is that it allows the use of variable names of unlimited length. These names can include letters, numbers, and the underscore character. For example, "year_to_date_sales" is a valid variable name. This feature alone permits the creation of BASIC source that is vastly more readable than standard BASIC.

With the precompiler, all BASIC line numbers are optional, and they can be replaced with line labels. Like variable names, these labels can be of unlimited length and can include letters, numbers, and the underscore character. The use of alphanumeric line labels makes "goto" and "gosub" statements much easier to read. For example, the precompiler statement, "gosub calculate_interest",

may be used instead of the standard BASIC statement "gosub 8460".

A simple form of string substitution, "string/macros", permits the definition of a string of text which can be given a name. When that name is later referenced in the source, it is replaced by the entire defined string. Several conditional compilation commands permit various portions of a source program to be conditionally precompiled. Other features include the following: a single BASIC statement, or logical line, can extend across multiple physical lines; comments can be embedded within BASIC lines or can stand alone on separate lines; variable types can be defined so that suffixes need not be appended to each variable; and the user has complete control over the printed source listing that the precompiler optionally outputs.

The output of the UNIFLEXTM BASIC 68000 Precompiler is a compressed program that the UNIFLEXTM BASIC 68000 Interpreter can run. The precompiled program cannot be listed or edited while in BASIC and, therefore, proprietary BASIC programs may be developed and distributed without the need to divulge the source code.

The UNIFLEXTM BASIC Precompiler requires the UNIFLEXTM BASIC Interpreter package. Although not a true compiler, the UNIFLEXTM BASIC Precompiler will add a new dimension to programming in BASIC resulting from a vast improvement in writing, understanding, and maintaining BASIC programs.

MP-C TO MP-T REVISITED

18 SEPTEMBER 1983
EO CALHOUN PO BOX 73426 FAIRBANKS, ALASKA
99707

AFTER READING OF THE MP-C TO MP-T MODIFICATION BY DONNIE WRIGHT ET AL (SEPT. MJ) I JUST COULDN'T WAIT TO TRY IT OUT. THIS MOD WAS JUST THE THING I NEEDED TO GET PRINTER SPOOLING WORKING AND WAS TAILOR MADE FOR MY SYSTEM. IN FACT, MR. WRIGHT MUST HAVE PEEKED INTO MY COMPUTER SHACK FOR BACKGROUND FOR HIS LETTER.

AS WITH MOST DEVELOPMENTS, EACH SUCCEEDING PARTY MAKES THEIR OWN CONTRIBUTIONS. HERE ARE MINE.

FIRSTLY, THE MOD IS EVEN SIMPLER TO IMPLEMENT THAN WAS INDICATED. REFERRING TO THE INSTRUCTIONS AND DIAGRAM IN THE SEPTEMBER ISSUE (PGS. 26-27) STEPS 3

AND 4 ARE UNNECESSARY AS CONTROL OF THE IRQ GENERATOR CAN BE ACHIEVED VIA PBO (PIN 10) WHICH IS ALREADY CONNECTED TO THE RESET INPUT OF THE DIVIDE COUNTER (IC3).

STEP 1 MAY ALSO BE UNNECESSARY SINCE P87 (PIN 17) IS TRI- STATED WHEN PROGRAMMED AS AN INPUT; HOWEVER, BY THE TIME I REALIZED THAT THE DEED HAD BEEN DONE, TOLD YOU I WAS IN A HURRY.

REGARDING STEP 7 (JUMPER C1 TO C0) THAT IS EASILY DONE BY SHORTING (SOLDER BLOB WILL DO) IC3 (PIN 1) TO THE BAUD RATE SELECT JUMPER (D) WHICH IS ADJACENT TO IT.

SO, SHORTING PIA PINS 17 TO 18 AND SHORTING IC3 PIN 1 TO D THEN STRAPPING FOR IRQ AND 110 BAUD DOES THE TRICK!

THE CB2 LINE AND ASSOCIATED CIRCUITRY INTERESTED ME ALSO SO I PLUGGED AN LED BETWEEN READER CONTROL (JACK PIN 9) AND GROUND (PIN 1) SO AS TO HAVE A VISUAL INDICATION OF WHEN THE THING IS ON.

WE ARE NOW IN THE REALM OF SOFTWARE AND PLEASE NOTE THAT DEPENDING ON HOW YOU PROGRAM THE DEVICE THE LIGHT MAY BE ON WITH THE INTERRUPTS OFF OR VICE VERSA.

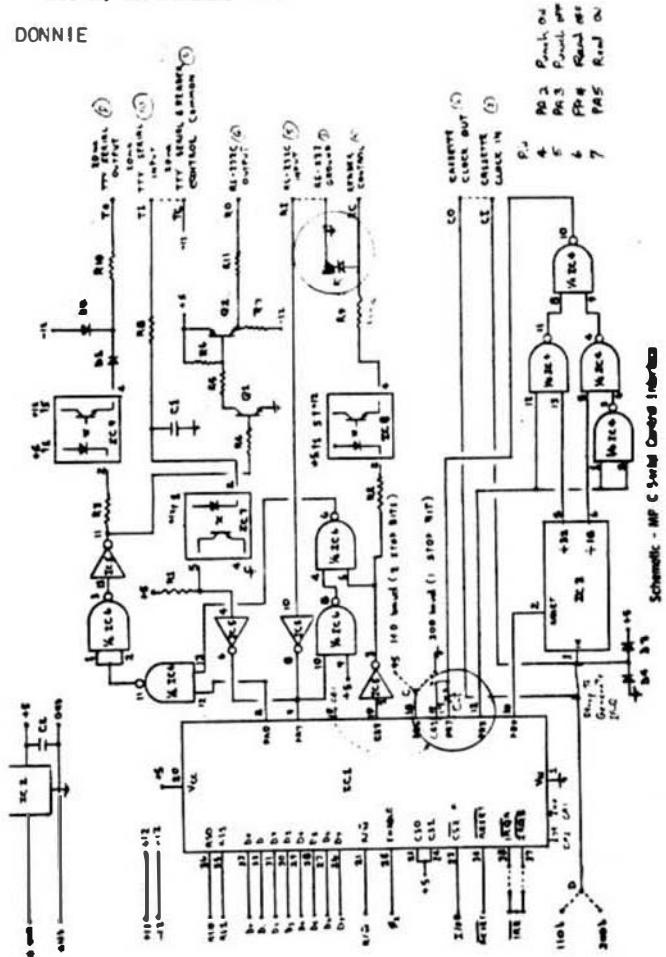

THE FOLLOWING LISTINGS SHOW THE PROGRAMMING TO HAVE THE LED AND INTERRUPTS ON OR OFF TOGETHER. THE SECOND LISTING IS A SIMPLE TESTING ROUTINE SO THAT YOU CAN CHECK THE FREQUENCY OF YOUR INTERRUPTS. DATA IN LOCATIONS \$0000,\$0001 WILL BE THE NUMBER OF IRQS' GENERATED PER INTERVAL (1 SEC IN LISTING).

BY THE WAY, YOU HAVE A CHOICE OF TWO IRQ INTERVALS AS DETERMINED BY THE STATE OF PB2. PB2=0 9 MSEC/IRQ OR PB2=1 18 MSEC/IRQ AT 110 BAUD. YOU CAN USE 300 BAUD TO GENERATE FASTER INTERRUPTS. PRETTY NEAT.

IN ACTUAL PRACTICE MY INTERRUPTS CAME AT THE RATE OF 108 PER SECOND (9.26 MS) AND 54 PER SECOND (18.6 MS).

ENJOY, AND THANK YOU.

DONNIE

A Special Thank You!

We want to express our thanks to all our customers. We have always felt that AAA Chicago Computer Center has the best and most loyal customer base that any dealer has ever had. Many of our customers have grown with us since April 1977 when we first opened our doors in Chicago.

Also, we would like to thank the manufacturers and vendors that we represent. Without their help and eager support, we never could have been able to supply our clients with the service that they have grown to expect from us. Together, we all form a team. Again, we want to acknowledge our thanks.

We'd like to note that our relationship with Smoke Signal Broadcasting and Southwest Technical Products dates all the way back to our beginning in April 1977. Not to slight anyone, we want to express thanks to our other vendors namely Technical Systems Consultants, Microware, Star-Kits, and our most recent addition, Helix.

At this time, we can say that we've probably installed more mixed SS-50 bus systems than any other dealer. For example, at the time we prepared this ad, we had 16 versions of FLEX (TM) drivers permitting the installation of our ELEKTRA Winchester systems with almost all versions of existing SS-50 and SS-30 floppy controllers.

While it is impossible and not economically feasible to support all combinations of hardware out in the field, we're trying our best. AAA Chicago Computer Center is the place to turn to when either adding on to your current SS-50 systems or purchasing a new one.

New this month is our \$125.00 auxiliary power supply permitting the installation of a second Winchester drive in our ELEKTRA computer cabinet. (Did you know that the ELEKTRA computer cabinet was the first SS-50 cabinet to include an EMI filter? The EMI filter has been included at no extra cost from the very beginning).

Did you know that our best selling 80 x 24 CRT terminal is the Hazeltine 1420? They are brand new and selling for only \$375.00 plus shipping.

Best wishes for a happy and healthy holiday season.

ELEKTRA COMPUTER CABINET THE LARGEST SS-50 COMPUTER CABINET				
AVAILABLE! Made of heavy weight 0.090" thick aluminum. Interior is 18-1/2" wide by 21-7/8" deep by 6-3/4" high. Heavy duty A.C. line cord, A.C. fuse holder, EMI filter, Fan with filter. Back panel has 10 cutouts for D-type data connectors. Front panel has key on/off power switch, 2 illuminated push button switches (Reset and NMI/Abort), and two cutouts for 5-1/4" disk drives.				
Fan Filter	\$10.00			
POWER SUPPLY Highest quality linear power supply CONSERVATIVELY rated at 15a @ 8v, 3a @ 16v, 3a @ -16v. 3 primary inputs for light, rated, and heavy loading. 220v Version: \$200.00				
110v Version: \$175.00				
DISK REGULATOR BOARD WITH CABLES Standard version for 2 floppy drives \$ 00 Heavy duty version for 1 Winchester drive and 1 floppy drive				
	\$75.00			
AUXILIARY POWER SUPPLY to power second Winchester drive	\$125.00			
ENGINEER'S "FUN BOX" BY ELEKTRA Computer cabinet with high quality 10 amp power supply. EMI filter, fan. Large enough to hold the standard size SS-50 type motherboard.				
	\$225.00			
ELEKTRA UNIVERSAL SS-50/SS-50C MOTHERBOARD Heavyweight 0.125" thick, 16" long by 9" wide, 11 memory (50 pin) slots, 8 I/O (30 pin) slots. Complete address decoding and selection, as well as extended address capability, for I/O slots. Choice of 4, 8, or 16 addresses per I/O slot. 1" spacing between all memory and I/O slots. On board baud rate generator with low and high ranges providing jumper selectable rates of 75 through 38,400 for each of the five baud rate lines. Slave device circuitry permitting 1 MHz 30 pin disk controllers to run with 2MHz 50 pin CPU boards.				
Mounting hardware	\$5.00	Board w/documentation	\$80.00	
Kit w/gold connectors	\$320.00	Assembled w/gold connectors	\$380.00	
Kit w/ln connectors	\$240.00	Assembled w/ln connectors	\$300.00	
ELEKTRA CHASSIS Includes cabinet, 110v power supply, power supply cables, side disk regulator board with power cables, motherboard with gold square pin connectors, assembled and tested.				
	\$450.00			
ELEKTRA CPU 9/9 Use either the 6802 or 6808 (to run 8800 software) or 6809. Has provision for up to 3 2716 EPROMs, 1K scratchpad, MC6840 triple timer, and an option 1 baud rate generator providing baud rates from 110 through 38,400 baud in two user selectable ranges. Versions of OS-9 level 1 are available.				
Bareboard \$80.00		Assembled \$275.00		
Optional Baud Rate Generator	Kit: \$225.00			
ELEKTRA DPP-D ALPORT SERIAL CARD Fits the standard 30 pin -50 bus/I/O slot. Can be configured for 4 or 16 addresses per port. RTS, CTS, OTR, DCO, IRO, FIRQ/NMI, and baud rate can be appropriately implemented for each port.				
Bareboard \$20.00	Kit: \$60.00	Assembled \$80.00		
Cable with mounting hardware (two needed per board)	Each: \$25.00			
Cable Each: 20.00	Mounting hardware per cable: \$5.00			
ELEKTRA DPP DUAL PORT PARALLEL CARD Fits the standard 30 pin SS-50 bus/I/O slot. Can be configured for 4 or 16 addresses per I/O slot. The direction of the TTL buffers can be controlled by either on board jumper connectors or by a signal from the peripherals. The interrupt request line for each port may be individually jumpered to either the I/O or FIRQ/NMI bus line.				
Bareboard \$20.00	Kit: 60.00	Assembled \$80.00		
Cable with mounting hardware (two needed per board)	Each: \$25.00			
Cable Each: 20.00	Mounting hardware per cable: \$5.00			
ELEKTRA 64K STATIC RAM/ROM MEMORY BOARDS with gold connectors. (Not available) Assembled and tested. With 36K RAM \$289.00 With 84K RAM \$299.00				
ELEKTRA UNIVERSAL SUPER FLOPPY CONTROLLER THE BEST 30 PIN FLOPPY DISK CONTROLLER THAT YOU CAN BUY! Controls up to four 5-1/4" drives and four 8" drives for a total of eight system drives. (FLEX system limit is four drives.) Single density or double density, 1MHz or 2MHz. 6800 or 6809. (Double density 8" must be at 2MHz, all other combinations of performance are possible.) Analog phase locked loop data separators with separate adjustments for 5" and 8" drives. Analog write precompensation circuit with separate adjustments for 5" and 8" drives. Designed to meet the data hold requirements of Western Digital floppy controller IC. Assembled and tested.				
Disk with drivers and formatting utilities. (Specify 68009, FLEX/OS-9)	300.00			
ELEKTRA WINCHESTER SYSTEMS THE BEST WINCHESTER SYSTEMS THAT YOU CAN BUY! Has automatic error detection and CORRECTION of up to 11 bad burst errors. SS-50 bus extended addressing capabilities, DMA, on board sector buffer, drivers included for 68009 FLEX or OS-9. Specify which version of FLEX that you are using. Drivers for FLEX2 (68000) are available for an additional \$100.00. Price includes host interface, controller, drivers, and cables.				
12 Megabyte single drive sys \$299.00	24 Megabyte dual drive sys \$395.00			
19 Megabyte single drive sys \$299.00	38 Megabyte dual drive sys \$489.00			
(19 Megabyte drives are the best that can be supported by FLEX)

► WARNING AAA Chicago Computer Center does not provide repair or diagnostic service for customer assembled PCs. AAA Chicago Computer Center does warranty and maintain service for our assembled boards. The customer should carefully take into consideration the small differential separating out kit and assembled prices when making his choice of purchase.				
We have introduced our line of computer equipment with the purpose of offering the highest quality of components possible at affordable prices. These products are intended for OEM applications where it is the responsibility of the purchaser to integrate these components with suitable memory, disk controllers, drives, and software along with I/O terminals to form working computer systems.

BASIC SEARCH

JOHN F. RUMNEY
8007 E. 366TH ST.
BELTON, MISSOURI 64012
PH 816-301-0350

13 AUG 1983

FOR MANY YEARS, I HAVE BEEN WRITING PROGRAMS IN BASIC USING MOST OF THE DIFFERENT VERSIONS PRODUCED BY SWTPC. IN ALL OF THE VERSIONS I HAVE USED, I HAVE NOTICED ONE SHORT-COMING THAT HAS HINDERED ME QUITE A BIT. THEY DON'T HAVE A SEARCH COMMAND.

HAVE YOU EVER WRITTEN A LONG PROGRAM AND, HALF WAY THROUGH IT DISCOVERED YOU HAVE MISSPELLED A WORD THROUGHOUT THE ENTIRE PROGRAM? OR DECIDED, FOR ONE REASON OR ANOTHER, THAT YOU WANT TO CHANGE A VARIABLE FROM ONE CHARACTER TO ANOTHER? WELL, I HAVE, AND TO FIND ALL THE USAGES OF THAT WORD OR VARIABLE, I HAVE TO SEARCH THE ENTIRE PROGRAM, LINE BY LINE, AND READ EACH WORD TO FIND ALL OF THE PLACES WHERE I HAVE USED THEM. THIS CAN BE QUITE TIME CONSUMING.

TO ALLEVIATE THIS PROBLEM, I HAVE WRITTEN A SEARCH ROUTINE FOR SWTPC BASIC VER. 3.0. I USE THIS BASIC WITH MY EMATATAK STRINGY FLOPPY AND THEIR SIMPLEX-66 VER. 2.0 OPERATING SYSTEM FOR A 6800 MICROPROCESSOR. THIS SYSTEM, AS MOST EVERYONE KNOWS, IS PRACTICALLY IDENTICAL TO THE TSC FLEX 2.0 105. REALIZING THAT MOST PEOPLE DON'T HAVE THE SIMPLEX-66 OPERATING SYSTEM, I HAVE CONVERTED THE ROUTINE ADDRESSES TO THOSE OF THE FLEX 2.0 SYSTEM.

SINCE MY VERSION OF BASIC WAS MODIFIED BY EXATION FOR THE STRINGY FLOPPY, YOU MIGHT HAVE A PROBLEM LOCATING THE ADDRESSES FOR THE VERBEG AND VEREND BOU'S. I SEE ONLY THE LAST HALF OF THE VERB TABLE IN MY ROUTINE AND THIS STARTS WITH THE VERB "LIST". THIS VERB IS PRECEDED, IN MY BASIC, WITH THE BYTES 00 99 99. START WITH THE ADDRESS OF THE FIRST BYTE AFTER 99 99 AS YOUR VERBEG EQU. THE LAST VERB IN MY TABLE IS "STEP", FOLLOWED BY THE BYTES 00 12 90. THE ADDRESS OF THE BYTE 90 IS THE ADDRESS YOU WANT TO USE AS YOUR VEREND EQU. AGAIN, BE SURE IN MIND THAT THE BEGINNING AND ENDING ADDRESSES OF THIS PART OF MY VERB TABLE MAY BE DIFFERENT FROM YOUR VERSION 3.0. SO, ADJUST ACCORDINGLY. OTHER THAN THESE TWO ADDRESSES, YOU SHOULD HAVE NO PROBLEMS ADDING THIS ROUTINE TO YOUR BASIC.

PRESS RELEASE

47MB HIGH PERFORMANCE WINCHESTER DRIVES

For use with 8MHz versions of QBasic or UNIFLEX.
Average access time is 30 milliseconds.

SMB REMOVABLE PAK WINCHESTER DRIVES

For use with 8MHz versions of FLEX or QBS. Can be used as
back-up or for systems not requiring larger disk Winchester.
1/2 height size allows QBasic systems to be configured with
5.25" or 10.8" Winchester, 1 floppy, and 1 or more.

The above new lines are now in stock. 8MHz earthware systems
can be ordered using Winchester and/or Platters. Existing 8MHz
systems owners can upgrade.

Contact GIMIX to customize your system to your needs.

Mr. Don Williams
Editor, '68 Micro Journal
5900 Cassandra Smith
P.O. Box 849
Nixon, TN 37343

Dear Mr. Williams:

We would like to announce the formation of a 6800 User's
Group in San Antonio, Texas. Our group is small, at present, but
we are interested in both hardware and software aspects of the
6800 microprocessor. We plan to meet informally about once a
month, and all interested persons are welcome to attend. For
more information, please contact Dave Lapointe, after 7:00 P.M.
at 512-732-6876 (voice).

Sincerely,
Dave Lapointe et al.

68 MICRO JOURNAL
5900 Cassandra Smith
P.O. Box 849
Nixon Tennessee 37343

ATT: Mr. Don Williams Sr., Publisher

Dear Don:

As you probably remember I sent you a program called
BASLIST, which you accepted for input in your excellent JOURNAL.
Since that time I have made some improvements in the program. As
now written, the program allows user selection of LEFT
MARGIN, and will automatically indent the wrap around portion of
a line properly, for line numbers of up to 5 digits. Also the
number of wrap around lines is unlimited, depending only on the
length of a line permitted by BASIC. It does come into
play, however, for large left margins.

I am enclosing a copy of the improved program in both the
normal 16 C.P.I. and condensed 16.5 C.P.I. modes. Note that
the left margin is set at 25 in the 16.5 C.P.I. mode. This may
be changed to suit by altering 'X' in line 568.

I am also enclosing a copy of the program for the RS COLOR
COMPUTER in the event you may want to use it also. It has all
the attributes of the FLEX version except for the absence of the
Condensed mode.

In the hope that you have not yet set the version of the
program which I sent earlier, please destroy it and use this
improved version.

Sorry for any confusion that all this may cause you. Don, but
I thought it worthwhile to send these new programs along.

I am using an OKIDATA 83R printer. CHR\$(29) and CHR\$(30)
print 16.5 and the normal 16 C.P.I. respectively.

Very truly yours,

John H. Deal

520 NEXT J
530 RETURN

```

AX = " " : FOR J = 1 TO I: AX = AX + "":NEXT J
where I is the required length.

If that is not impressive enough then consider the following :-

MOVE ALL "ABCDE" TO DATA-NAME.

This sentence will fill DATA-NAME with "ABCDE" repetitively until the field is full, truncating the result to fit. It can be done in BASIC but only with complicated code. Even if the TSC BASIC field definitions are used then the program is :-

```

BS = "ABCDE"
FOR J = 1 TO I
  M = BS.BS
NEXT J
LSET AX = BS

```

where I has to be chosen such that LEN(BS) > LEN(AX).

When it comes to formating print lines or data records then it is best to draw a discrete veil over the capabilities of BASIC. The current BASIC gets the "PRINT USING" statement and there is simply no comparison between this and the COBOL edited picture.

This is NOT intended as a diatribe against BASIC. I'm simply making the point about language design. The same or similar points could be made about other languages like PASCAL or FORTH. The language is not designed to do this sort of thing and as any attempt to force the issue results in a lot of complicated code and unwarranted assumptions.

Getting into the COBOL philosophy means dropping some of the informal ways of programming and at first it may seem slow compared to an interpreter. There is nothing clever than sitting over a hot machine writing bad code which in a few weeks is incomprehensible to the author and everyone else.

I'm sure that there are a lot of people out there who are as tired of fighting the software as I am. COBOL is not a universal panacea, it is just the best available solution for the standard data handling problems which most programs are all about, unless of course you are uninterested in processing data. In which case why have a computer?

Our COBOL implementation for PLEX has all the features of level 1 and some of the useful features of level 2 COBOL. There is a runtime package which is normally memory resident. We have included linkage features which make program development a snap. We are committed to providing support for COBOL for the foreseeable future and will be making enhancements to the compiler as time allows. Future plans include inexpensive application packages based on our compiler. There is already a wealth of published information on COBOL and COBOL based applications, both for miniframes and micros.

PRESS RELEASE

September 15, 1983
For Immediate Release
Contact: Aedy Bell, 515-279-8844

A NEW OS-9 TOOLBOX FOR FILE MANIPULATION

Microware has announced a new utility command toolbox especially designed for OS-9 users who do a lot of file manipulation. The package is a collection of twelve OS-9 command programs, including equivalents of some of the most popular UNIX utilities that are not included in the basic OS-9 command set. Most of the programs are useful as "filters" using the OS-9 pipeline facilities.

Programs included are: "tr" which translates all occurrences of a simple or complex text patterns within a file to a specified substitution pattern; "grep" which searches a text file for a pattern and prints matching lines; "count" which counts words, lines, or characters within a text file; and "fd", an unformatted directory listing with "wild card" matching.

Also included are "expand" and "compress", which are character compression and decompression utilities that can reduce the size of text files; "split" which breaks a file into smaller files; "spool" which collects lines and spaces lines to a text file; "decode" which decodes terminal keys to hex notation; "sgrep" which is a quick sort small files, directories, etc.; "pr", a versatile formatted file printing utility; and "xmodem" which is used to alter terminal port operational mode.

MICROWARE INTRODUCES 6809 C COMPILER

A complete C language compiler for the Motorola 6809 microprocessor has been introduced by Microware Systems Corporation for its popular OS-9 operating system. The Unix-

COMPUSENSE LTD.

Computer Systems Consultants

Don Williams
68 Micro Journal
Elizabethtown
Tennessee

Dear Don,

Finally I enclose a copy of our COBOL compiler for PLEX. This product has taken about two years to complete, and even now the manuals enclosed are preliminary versions. If you are happy with the product then the next thing I want to do is to advertise in the journal.

A lot of circumstances have conspired to delay this software. Mainly the time taken in writing the manuals. This year we have written and published a total of five software products for the DRAGOS computer since January, including an assembler, monitor and full screen editor. Our software is about the most popular, of its kind, in the U.K. for the DRAGOS and the assembler features in a new book, to be published in November, on DRAGOS machine code by Ian Sinclair.

I guess a word or two about "why COBOL?" is in order. I suspect that by interest in PLEX and the 6809 is about as passionate as most. Many bugs are into action related performance and this is similar to the early days of miniframes. witness the number of articles in the 68 journal comparing the performance of various microprocessors. Trouble is, when I actually want to write a useful program then I'm not interested in performance at the expense of readability or fancy structured syntax without precise control of DATA.

Like many people I tried precompiler BASIC and although this is a vast improvement over other methods of progressing there is no significant improvement in language function. BASIC, or for that matter PASCAL, FORTH etc., is incapable, by DESIGN, of most of the standard C.P. functions which I need when writing programs. For example string handling verbs in BASIC are a bolt on extra which was invented to circumvent the imprecision that BASIC defines in variables.

COBOL is designed for its syntax, verbosity, structure and the flavor of the paper it uses. In fact I have rarely set a buff who likes COBOL at all. On the other hand most programmers who have to produce functional applications software regularly use COBOL. There is a good reason for this, COBOL was designed for data processing and over years it has proven itself to be capable of just that. The availability of a COBOL compiler means a commercial acceptance of the capabilities of a computer or operating system and it is high time that this facility was available for PLEX.

COBOL scores for its elegance in data definition, and it has a well defined language structure purposely designed to handle sequential record structures. As a result most programs, and programmers, only need to use a minimum of program syntax to achieve results.

For example to clear out a data field to spaces one simply says :-

MOVE SPACES TO DATA-NAME.

In BASIC this would be :-

structured constructs and other concepts intended to assist in the development of programs embodying such desirable traits as structure and modularity. PL/9 is a true compiler, generating 6809 machine code, without the use of an intermediate assembly language stage.

The A/BASIC language is a version of BASIC without many high-level constructs often found in general purpose versions of BASIC. It also has several lower-level constructs not normally found in other versions of BASIC. Although it has no structured constructs as does PL/9, it does have string processing and input/output constructs supporting terminal and disk files, unlike PL/9, which has no string or input/output constructs, and thus may be logically classified as a high-level language. A/BASIC is a true compiler generating 6809 machine code, without the use of an intermediate assembly language stage. A/BASIC is also available in a version for the 6800, although several features (such as random disk I/O) are available only in the 6809 version.

DOCUMENTATION

The product documentation is the first representation of a new new product that a prospective buyer investigates or a new user normally studies. It is important for the manual to convey a sense of the product's worth to the reader. Both A/BASIC and PL/9 have problems with their manuals which could be corrected if the proper emphasis were placed on documentation.

The PL/9 manual is far superior to the A/BASIC manual. It has a table of contents, lacking in the latter. It is lengthier, easier to read, and contains more detailed descriptions and examples than are in the A/BASIC manual. Neither has an index nor quick reference syntax guide, although quick reference guides are provided at the end of this article.

Neither has an introductory section to introduce a newcomer to the language. Both manuals are rather disorganized and make it rather difficult to find some specific points, such as statement, operator, and function syntax and semantics. However, the PL/9 manual has a very detailed description of the internal specifications of the PL/9 compiler.

The PL/9 manual appears much more professionally done than the A/BASIC manual. It is prepared on a word processor and the A/BASIC manual is manually prepared and has strange vertical and horizontal spacing, probably due to multiple levels of revisions, additions, and deletions.

NUMBER REPRESENTATION

Both A/BASIC and PL/9 support 8 and 16 bit integer arithmetic. PL/9's 8 bit arithmetic is signed, unlike A/BASIC's, which is unsigned. Both A/BASIC and PL/9 support signed 16 bit arithmetic, although A/BASIC also supports unsigned 16 bit arithmetic. .

Both languages allow the entry of numeric constants in either decimal or hexadecimal notation. Literal numbers are assumed to be in decimal notation unless preceded by a dollar symbol, in which case they are assumed to be in hexadecimal notation.

Neither language supports floating point or extended precision arithmetic directly, although both have the ability to perform both indirectly, thru the use of assembler or machine language subroutines.

The PL/9 supporting library appears on the disk is but not covered in the manual except for a mention of how to include a library member. It contains several useful packages, including a floating point library and a compatible scientific library containing the basic trigonometric and transcendental functions.

NAMING CONVENTIONS

A/BASIC uses a highly restrictive naming convention common to many BASIC processors. Variable names must start with a capital letter and may contain a second character, which may be a digit for numeric variables or "\$" for character variables (strings). Numeric variables may be subscripted with one or two dimensions and character variables may be subscripted with one dimension. Character variables may be up to 32 bytes in length, unless they have a declared length, in which case they may be up to that number of bytes in length, which may not exceed 255. The first element of an array is number 1, and may be referenced with or without the (1) or (1,1) subscript. The number of elements in a subscripted variable must be a constant and cannot exceed 65535.

PL/9 uses a much less restrictive naming convention than does A/BASIC, allowing variable names to be up to 127 characters in length, all of them significant. Variable names must start with a capital letter, which may be followed by up to 126 capital letters, digits, and underscores, in any order. Since all variables must be declared, there is no need for a naming distinction to distinguish between 8 and 16 bit variables. Variables may be subscripted with one dimension, which must be a constant not exceeding 32767. The first element of an array is number 0. If a variable name is prefixed with a period, it is assumed to contain not a value but a pointer to a value, used in a manner similar to the pointer variables in "C".

DECLARATIONS

The only explicit declaration in A/BASIC is DIM, which declares a string or a numeric or string array. Variables may also be declared by use, and misspellings may cause new variables to be created, when the intent was to use existing variables.

PL/9 requires the declaration of all variables, avoiding A/BASIC's accidental creation of variables, but requiring

somewhat more planning by the user. Variables may be declared as BYTE or INTEGER, analogous to the string and numeric variables of A/BASIC, and may be subscripted by following the declaration with the size in parentheses. For instance, the following is an example of PL/9 declarations:

```
BYTE BUFFER(80), FLAG: INTEGER COUNT, LINES;
```

Named numeric constants may be declared with the CONSTANT declaration, which is used in the following format:

```
CONSTANT CR=13, LF=10, SPACE=32;
```

One of the more powerful declarations supported by PL/9 is PROCEDURE. Its closest A/BASIC analog is a subroutine which is the target of a GOSUB. It establishes a named subroutine with or without parameters and with or without local variables. Any parameters are enclosed in parentheses immediately after the procedure name and are separated by colons. The declarations of any local variables immediately follow the parameter list. Parameters and local variables are declared as BYTE or INTEGER and may be subscripted with one dimension only.

Executable code in a PL/9 program must be contained in one or more PROCEDURES. Each PROCEDURE may or may not return a value, and each call must be consistent with the declaration of the PROCEDURE. If a PROCEDURE is to return a value, its type (INTEGER or BYTE) is determined from the type of the expression returned by a RETURN or ENDPROC statement. Although it is not stated in the manual, the last PROCEDURE declared is assumed to contain the main program code. An alternate form of PROCEDURE is ASNPROC, which introduces a machine language subroutine, but is otherwise declared and used in a manner similar to PROCEDURE.

Variables declared outside of any PROCEDURES are global, and the word GLOBAL must precede the BYTE or INTEGER declaration. Only one GLOBAL statement is allowed per program unit. Global variables are accessible in all subsequent PROCEDURES. However, PROCEDURE parameters, local variables, and labels may have the same names as global variables, in which case the local declarations override the global declarations temporarily.

Labels are declared by usage within a procedure, and are local to the PROCEDURE of declaration. They are used only as the destination point of GOTO statements. They must conform to the naming conventions of other identifiers. The actual destination point is designated by a label followed by a colon.

The PL/9 symbolic debugger requires a table containing the names, addresses, lengths, and types of all variables used in the program. Thus the compiler restricts the user to 128 each of the following named variables:

```
procedures
globals
locals and parameters per procedure
labels per procedure
named constants
data statements
```

These restrictions will tend to limit the complexity of the programs processed with PL/9, although the typical program for dedicated applications is not very complex, in terms of the number of variables and labels required.

MEMORY ALLOCATION

Both PL/9 and A/BASIC have default and specified methods of allocating space for data, program, and stack areas.

By default, A/BASIC allocates variables starting at \$8000 up and PL/9 allocates variables starting at the end of the stack down, with PROCEDURE parameters and local variables using temporary locations at lower addresses than the fixed global variables. A/BASIC uses a statement of the following form to modify the current data pointer, and thus subsequent memory allocation:

```
BASE=address
```

PL/9 prefixes a variable declaration with a sequence of the following form to modify allocation for that declaration only:

```
AT address:
```

By default, A/BASIC starts program code at address \$1000 and PL/9 places program code as high as possible in memory; PL/9 code is position-independent, so this is possible. A/BASIC uses the following statement to modify subsequent program code allocation:

```
ORG=address
```

PL/9 uses the following statement to modify subsequent program code allocation:

```
ORIGIN=address
```

However, origin statements are ignored by the PL/9 symbolic debugger, which loads program code as high as possible in memory.

By default, A/BASIC and PL/9 use the stack space allocated by the monitor or operating system. Both use a statement of the following form to set the initial stack pointer:

```
STACK=address
```

PL/9 allows a statement of the following form to set the initial stack pointer to the start of the program code, assuming the statement is placed before any PROCEDURES:

```
STACK=
```

compatible compiler conforms to the Kernighan and Ritchie C specification including long, float, and double data types.

Because of the similar characteristics of the OS-9 and Unix operating systems, the C compiler provides source code level compatibility so that application software written for Unix can be also be run on OS-9 or the reverse. The output of the compiler is optimized 6809 assembly language source code which can be run on OS-9 or used in stand-alone systems such as ROM-based control systems.

A unique feature of the Microware C compiler is its real-time profiler capability. When activated, the profiler counts procedure invocations during program execution. A report printed after the program runs gives a statistical breakdown of function execution frequency. Using this information the programmer can identify which functions can most profitably be optimized.

A relocating macro assembler, linkage editor, and comprehensive standard function library is included in the compiler package. The standard library includes all C standard functions plus Unix and OS-9 system calls. Documentation consists of a comprehensive User's Manual plus a copy of the Kernighan and Ritchie book "The C Programming Language".

The C compiler package is available now from manufacturers and distributors of OS-9 based computers or directly from Microware.

"JUST" REVIEW

REVIEW OF JUST TEXT FORMATTER

This is a review of a new (yet another) text processor. It is dedicated to the Epson printer or any command compatible facsimiles. The name of the new formatter is JUST and it is available in the Flex operating system. It was written by Ronald W. Anderson, the talented author of Flex Users' Notes, a monthly column in this journal. The term, JUST, refers to "justify", the placement of the textline so that it is aligned with the other lines on the left or right margins or when needed, the center of the line.

JUST has most of the standard commands. They are invoked as follows:

,W:nn	Set width of line to nn characters
,M:nn	Set left margin nn spaces
,P	Starts a new paragraph
,S:nn	Skip nn lines
,J	Turns on justify mode
,Q	Turns off justify mode

There are, of course, many others. There are some commands that are unique and these form the most interesting facet of the new program. These are:

,E	Sets emphasized print mode on the Epson printer
,D	Sets double strike mode
,B	Sets both, for boldface characters
,N	Cancels the other Epson commands

On Epson printers equipped with a graphics ROM (Graftrax), there are provisions for inserting commands in the middle of text for cause special printing for less than an entire line. These include:

\0	Turn on italics
\1	Turn off italics
\2	Boldface (double strike) on
\3	Boldface (double strike) off

These commands are embedded within the text. For example, \0\everything from here to here\1 will be italicized. This example will \2be printed in boldface\3.

These commands can also be \0\2be printed in boldface italic\1\3.

The package includes the program source in a new compiler called PL9. There is also a short segment of

assembled code containing the code for the Epson commands. The instruction manual is present as a textfile with processor commands. JUST can be tried out by inserting the disk and typing:

I.JUST-CMD I.JUSTINST.TXT T

This will cause the instructional manual to be directed to the terminal. "P" can be used to send the processed file to the printer. Instead of "P" or "T" a file name can be used and the file will be saved in a processed form on the disk. When text is directed to a diskfile the printer commands are included. These, however, cannot be sent to the printer by the FLEX LIST-CMD routine which does not transmit characters with ASCII values below \$20. Epson commands utilize ESCAPE (\$1B). To get around this problem, a short utility file is included in the package.

This program, FPRINT-CMD, will send all characters to the printer and allow the text file to properly configure it. This works fine except for \$09 which is interpreted as Horizontal Tab by FLEX.

Thus far, I have described an interesting exercise in the study of text formatters. What is unique about JUST is that it is written in PL9 and the source is included. For we novices in PL9 (and structured programming in general), JUST is a superb entry into the use of PL9 to devise large programs of practical use. The source for JUST can be easily modified with any text editor and recompiled quickly for the purpose of studying PL9 or of making modifications and/or improvements in the program.

Perhaps it will serve as a vehicle to allow full utilization of the Epson printer with Graftrax option. There are already software packages in CP/M offering large numbers of character fonts for use on the Epson. The current version of JUST hopefully is just the beginning of a many refinements and additions. I enjoy using JUST and look forward to experimenting with the source.

Theodore A. Peintuch, M.D.

PRODUCT NEWS
October, 1983

XDMS V1.1

XDMS V1.1 is the first major revision to the XDMS Data Management System. This version incorporates several enhancements designed to add processing flexibility within the GENERATE process control statements. For example, it is now possible to do rate table lookups (eg; fax, FICA, etc) on ranges of values and incorporate the found values in subsequent calculations. Immediate commands have been added to permit in-process file deletes or purge, terminal messages and prompts, and optional escape from the process. GENERATE error handling is now non-fatal, allowing interactive users to correct or reenter instructions without reloading the program. XDMS V1.1 replaces V1.0 effective October 1, and is available for \$179.95. Upgrades for registered XDMS V1.0 users is \$29.00.

XDMS+

XDMS+ adds to V1.1 a set of useful utilities. SET permits display or change of the XDMS margin, width, page, ejects, backspace, end-of-line, delete, return echo, escape, reprint, null count, pause, backup, work drive and data values. PLOT produces horizontal bar, symbol or time charts. COPTDEF defines new files with existing formats. REVISE permits modification of file field definitions. OUTPUT dumps a .DMS file in tabular ASCII format. INPUT loads a .DMS file from dump output or user generated text. FORM displays the print form of a .DMS file. SIZE lists the number of file records and sectors. PURGE erases the data portion of a .DMS file. FILEB displays a file name matrix for a given file extent. REDEFINE allows change of a field name. The utilities are available separately to new XDMS V1.1 users for \$79.95 - However, since we value our existing customer base, we are extending a \$30.00 one time special to XDMS V1.0 users to purchase both XDMS V1.1 AND the utilities. This offer will expire December 1, 1983.

XACC

The XACC General Accounting System has also been redesigned under V1.1. The system now permits optional random access for the ACCOUNTS and PRODUCTS files, a user defined ORDER file, custom invoicing (similar to GENERATE's form capacity) and a percentage split of a transaction amount over two accounts. The aggregation process in BALANCES, CLOSSES, LEDGER and INCOME has been redesigned and is about five times faster. The product code field may now be alphanumeric if desired. XACC V1.1

(and XDM5 V1.1) are designed to run with 'narrow' screens of 30-64 characters if necessary (eg; the Color Computer). We have submitted a "V68" CoCo screen to South East Media for inclusion in the F-MATE pkg. This uses a 3-Pixel-1-Space character format and we will supply the module free with any order - If you assure us that you have purchased the F-MATE package. The new XACC V1.1 system sells for \$249.95 - However, if you guessed it! We will extend existing XACC V1.0 users the opportunity to upgrade for \$25.00 (XDM5 V1.1 is also required @ \$25.00 or the optional XDM5 V1.1 @ \$50.00).

MANUALS

The manuals for XDM5 and XACC have been reprinted. A new cover design with color stripes and bold lettering on a white background presents a professional appearance. Additional sections have been added for the utilities, and for additional operational detail. New manuals will be shipped with upgrades.

UPGRADES

Recently, South East Media became our primary dealer. As such we pay a sales commission for orders placed there. Since we are zoned as "residential" we cannot process credit card orders directly (don't ask) and must "factor" these orders thru our dealer (and pay a commission). On upgrades, we prefer check orders placed here - They can be processed quickly and alleviate confusion as to who is a valid user. We urge new users of AXT system to place initial orders with South East Media on 800-330-6800 (toll free USA). Once a subscriber, we prefer to deal on a "direct" basis which permits us to furnish you with the latest news and modifications on a timely basis. We are continuing to negotiate with our local Banks for credit card processing "privileges". Please draw foreign checks on U.S. banks and funds - Otherwise we are charged a \$15.00 fee by our bank to cash the check!

COSTS ARE UP

Right now, it looks like we might have to raise our prices in January. Commissions, royalty, advertising, printing, etc. all contribute to our costs, and our profit margin is narrowing rapidly. XDM5 sales are up, but not enough to compensate. We are also considering a three package approach, by adding an entry level XDM5 (remote reports only). This would be "level I" and would sell for \$100-120; standard XDM5 would be "level II" and sell for \$180-200, and XDM5 would be "level III" and sell for \$250-300. Existing users would upgrade between levels at a discount (difference + a percent) and between versions for \$25.00.

OS-9?

We are anxiously awaiting arrival of Radio Shack's OS-9, which seems to be held up in Tandy's quality control group. Rumor has it that there is a bug in the timing between disk operations and a second terminal. (Does anyone really connect a second terminal to a \$400. computer?) Having studied Microware's OS-9 manual, we think that a XDM5 version is feasible (but not easy). As soon as OS-9 is released, we intend to begin conversion of XDM5 code. This effort should take about 3 months. The FLEX version will continue to be offered as long as a demand exists.

APPLICATIONS

We are still looking for generic XDM5 applications for an applications manual. Seems like most users are using the system for very specific uses. Here, we have used it for private line network analysis and for cataloging data communications equipment - Not too applicable for a general applications manual. Any suggestions are welcome - Write Bill Adams, P.O. Box 107, Briarcliff, N.Y. 10510.

6 October 1983

Larry E. Williams, Editor
'68' MICRO JOURNAL
P.O. Box 849
Hixson, TN 37343

Dear Larry,

I guess that I am in the soup now that you published my letter to South East Media. No harm done to me, but some folks may take offense to my running a Z80 and CP/M on the 50-buss. As the old saying goes, "Since I'm already in the soup, I may as well stir."

META LAB Z809

Yes, I am running CP/M software on my Gimix 6809+. I'm doing it with a Meta Lab Z809 CPU board which I have had for longer than a year. Operationally, that Meta Lab Z809 is a fine complement to the Gimix. Even though it is one of the original Z809's, I have not had any problems with it at all. My Gimix is operating at 2 mHz, which puts the Z80 at 4 mHz, and I have never even seen so much as a dropped or garbled byte.

The way Meta Lab designed the Z809, it and the Gimix 6809+ CPU work together as dual processors with each one spe-

cializing in part of the work. The 6809 has control of the hardware and the Z80 services the application software. It's better than a marriage, neither gets in the other's way. That is, so long as I remember that the Z809 does not directly access the hardware. It hands-off all hardware instructions to the 6809. In turn, the 6809 passes all hardware specific information back to the Z809 for use in the CP/M applications programs. The data transfers are made in specially designated buffers.

BOOTING CP/M

Booting CP/M is as simple as slipping my FLEX system disk out of drive 0, sliding my CP/M system disk into drive 0, then doing a normal cold boot. CP/M comes up fast! It calls drive 0, drive A, and drive 1 is called drive B. The CP/M prompt includes the system drive letter, "A". The Meta Lab implementation of CP/M requires that the system disks and the work disks be kept separate. They can not be interchanged between drives because the system disks have three reserved tracks and the work disks have two reserved tracks.

META LAB CP/M

The software key to this highly successful dual processor scheme is the BIOS module of CP/M. The BIOS module in CP/M does all the I/O handling, including disk I/O. Meta Lab's BIOS is written 90% in 6809 code and 10% in Z80 code. Unfortunately, Meta Lab has not been able to support their BIOS very well, so to date, it has not been particularly flexible. It was written for standard 8" single side, single density disk format and a parallel interface printer. Last winter, they did provide some patch addresses which helped me make some critical changes. But because of my experience with Gimix-FLEX and my two Datatrak-8 drives, I have been spoiled with nearly 2 meg of disk storage. Furthermore, I can now see an application coming at me which will require hard disk.

I have spent more than 100 hours laboriously disassembling and interpreting Meta Lab's BIOS. The job is now about 80% complete. Without that premier disassembler, DYNAMITE+, this task would have driven me out of my mind. I now know that eventually I'll be able to take Meta Lab's BIOS all the way to a hard disk format. If I can get permission from Meta Lab, I'll be willing to share the heavily commented, though not reassemblable, results of my effort with your readers by publishing it in '68' MICRO JOURNAL.

CP/M vs. FLEX

Now the big issue, CP/M vs. FLEX! Will I contribute anything useful to the debate? Yes and no. If you're looking for loyal unqualified support for FLEX, I'm going to disappoint you. On the other hand, I don't rate CP/M as better. Confusing? Well I prefer to stick close to facts, especially in debates. Running both systems on the same computer

has given me an excellent opportunity to make some observations.

CP/M and FLEX are not directly comparable. CP/M is a primitive operating system with hardly any capability of its own. While FLEX is a sophisticated operating system with a full-house of features; it seems to have a life of its own. CP/M's sole purpose seems to be to support applications programs. However, quite a body of utility programs have been written for it.

With regard to system-level utilities, I have far greater respect for the ones I find associated with FLEX and the 6809. I attribute this strongly to the knowledge and skill of the people writing system software for the 6809. I will even go so far as to make the statement that there are better quality system-level programs being given away in this magazine than are available for purchase for the Z80 and CP/M. There is, however, a complete rewrite of CP/M in the public domain, called ZCPR2 (by Rich Conn). It has good reviews. I have a copy of it, but have not installed it, yet.

However superior I think 6809 system software may be, I think the opposite about applications software. I did not spend my money to buy a Z809 board because I was curious. I was forced to do so because of lack of high quality, heavy duty applications software running on FLEX. That was in the Spring of 1982. In 1983, I have been encouraged by the increase of application software advertising in '88' MICRO JOURNAL.

PERFORMANCE

The Meta Lab Z809 and implementation of CP/M does not seem to impair processing speed noticeably. For example it seems from Wilbur Killebrew's letter in the October issue that the 50-buss still lacks a useable FORTRAN. I also have been victimized by the FORTRAN fiasco on the 50-buss to the extent of several hundred dollars, but at an earlier time and with a different vendor. Now, Meta Lab's Z809 has enabled me to run Microsoft FORTRAN on the 50-buss. I benchmarked the now infamous Gilbreath's version of "Eratosthenes' Sieve" at 15 seconds. This is 17 times faster than Wilbur Killebrew got out of TSC's FORTRAN, and 33% faster than I clocked the same program on a PDP-11/70 (RSX-11M+ operating system, F77 compiler, no other users on the system).

VENDOR

The Z809 was last advertised in '88' MICRO JOURNAL in the August 1983 issue, page 59. It was priced at \$595, and can be ordered from:

Meta Lab
6825 County Line Road
Longmont, CO. 80501

RELINK

RELINK AVAILABLE DISK SECTORS

BY

JOSEPH D CONDON
4505 86TH STREET APT 28
DES MOINES, IOWA 50322
TELEPHONE 515-278-4581

THE FOLLOWING PROGRAM (WRITTEN IN FLEX09 ASSEMBLER) RELINKS ALL THE AVAILABLE SECTORS ON A FLEX09 FORMATTED DISK INTO ASCENDING ORDER. THIS MINIMIZES THE CHECKER BOARDING EFFECT WHICH SLOWS DOWN FILE ACCESSING TIME. THE PROGRAM BUILDS AN AVAILABLE SECTOR BIT MAP IN MEMORY WHICH IT THEN USES TO REWRITE ALL AVAILABLE SECTORS AND SECTOR LINKAGE. THE BIT MAP REQUIRES 8K OF MEMORY WHICH WILL ALLOW THE PROGRAM TO RELINK A DISK CONTAINING UP TO 65536 FREE SECTORS. THE TOTAL MEMORY REQUIREMENTS FOR THE PROGRAM IS APPROXIMATELY 9K, MOST OF WHICH IS USED FOR THE SECTOR BIT MAP. THIS PROGRAM IS NOT RELOCATABLE IN ITS PRESENT FORM. ALTHOUGH THE PROGRAM IS INTENDED TO WORK PROPERLY ON ALL TYPES OF DISK DRIVES, IT HAS ONLY BEEN TESTED ON SINGLE SIDED, SINGLE DENSITY, 35,40 AND 80 TRACK DRIVES. IF YOUR DRIVE IS NOT ONE OF THE ABOVE MENTIONED I WOULD SUGGEST USING THIS PROGRAM WITH CAUTION FOR THE FIRST TIME UNTIL YOU ARE CONFIDENT THAT THE PROGRAM WORKS PROPERLY. I HOPE THIS PROGRAM SAVES YOU AS MUCH TIME AS IT HAS ME IN THE PAST.

GIMIX II CPU+, 2 Mhz, with FLEX and OS-9 - Level 1, Ver. 1.2, latest as of 9/1/83. This CPU board is like new, we went to GIMIX III system. Set up and ready to run. With FLEX and OS-9. Have both on your system and just call FLEX or OS-9. Includes software and documentation. Also Time of day clock, FLEX DAT, OS-9 FPLA. Set up to require GIMIX #68 DMA disk controller. Original cost over \$900.00. Special only 729.95 plus shipping (3.50). Ask for Don, Tom or Bob - 1 615 842-4601. **This will not last long!**

TELETYPE Model 43 PRINTER - with serial (RS232) interface, and full ASCII keyboard. **LIKE NEW** - New cost \$1295.00 **ONLY \$759.00** ready to run - Call Tom - Larry - Bob, CPI 615 842-4600

FOR SALE: SWTP S/00, 6809 CPU, H19 Terminal Dual 96TPI Drives, 64k RAM. Includes software, several add-on boards. Cost new >> \$8700.00. Asking \$5100.00. For complete listing call 816-524-3777 (work) 816-524-1123 (home) or write Bill Thorsen, 200 Wingate, Lee's Summit, MO 64063.

Used SWTPC hardware: 8212-W Terminal \$895; MP-8M 8k boards \$100ea.; MP-M 4k boards \$50ea.; MP-A VDU board \$25; AC-30 Cassette I-O \$25. Unused F&D CPU-2 and AD209-1 6809 adapter all parts except rom \$150. Jonathan Meler 802-254-2285, Box 573, Brattleboro VT 05301.

FOR SALE: MSI 6800 computer system. Includes: dual 8" drives, LSI ADM-3A terminal, 2 Serial interfaces, and more. Software (BASIC compiler, and more) is included. All in good working condition. Best offer. Call or write for details. Mel Woolf, 10808 Midsummer Drive, Reston, VA 22091.

FOR SALE - USED TANDON 80 TRACK DS DD 5 1/4" DISK DRIVES RECONDITIONED-\$250. Call 314-291-2728 - Ask for Russell.

New and used boards by GIMIX and SWTPC. Send SASE to: Manfred Pescke, Story Hill Rd, RFD 3, Goffstown, NH 03045

6809 DEVELOPMENT SYSTEM FROM CREATIVE MICRO SYSTEMS

System includes the CMS 9619 single board microcomputer with 2 MHz clock rate, on-board I/O consisting of 2 PIA's, 2 ACIA's, one PTM, non-volatile time/date subsystem, priority interrupt vector generator, powerfall protection/restart system, and bank select outputs for memory map expansion.

System comes with CMS 20MB Winchester Disk with 8" floppy backup.

OS-9 Editor, Assembler, Debugger, and BASIC 09 are included.

The entire system is pin and outline compatible with the Motorola Exorciser and EXORbus standard products.

CMS supports this system with a variety of memory, I/O expansion modules, controllers, etc.

The system is packaged as an attractive desk-top unit and comes with 56K static RAM.

This package was purchased from CMS a year ago for about \$9,000. Our company has cancelled current development projects and we are now required to sell this system.

For more information please contact Computer Group Supervisor at 713-932-7777, Ext. 240.

FOR SALE: GIMIX 6809 System. 128K RAM. 38 MEG SWTP HARD DISK. Dual DSDD 8" DISK DRIVES. Mint Condition with extremely low on-time. Have purchased another system, must sell. Make offer. David Klein (201) 291-5575 after 12.

COMPILER EVALUATION SERVICES By: Ron Anderson

The S.E. MEDIA Division of Computer Publishing Inc.
is offering the following "SUBSCRIBER SERVICE":

COMPILER COMPARISON AND EVALUATION REPORT

Due to the constant and rapid updating and enhancement of numerous compilers, and the different utility, appeal, speed, level of communication, memory usage, etc., of different compilers, the following services are now being offered with periodic updates.

This service, with updates, will allow you who are wary or confused by the various claims of compiler vendors, an opportunity to review comparisons, comments, benchmarks, etc., concerning the many different compilers on the market, for the 6809 microcomputer. Thus the savings could far offset the small cost of this service.

Many have purchased compilers and then discovered that the particular compiler purchased either is not the most efficient for their purposes or does not contain features necessary for their application. Thus the added expense of purchasing additional compiler(s) or not being able to fully utilize the advantages of high level language compilers becomes too expensive.

The following COMPILERS are reviewed initially, more will be reviewed, compared and benchmarked as they become available to the author:

PASCAL "C" GSPL WHIMISCAL PL/9

Initial Subscription - \$39.95
(Includes 1 year updates)
Updates for 1 year - \$14.50

DYNAMITE+

"THE CODE BUSTER"

disassembles any 6809 or 6800 machine code program into beautiful source

- Learn to program like the experts!
- Adapt existing programs to your needs!
- Convert your 6800 programs to 6809!
- Automatic LABEL generation.
- Allows specifying FC8's, FCC's, FDB's, etc.
- Constants input from DISK or CONSOLE.
- Automatically uses system variable NAMES.
- Output to console, printer, or disk file.
- Available for all popular 6809 operating systems.

FLEX™ \$100 per copy, specify 5" or 8" diskette.

OS-9™ \$150 per copy, specify 5" or 8" diskette.

UniFLEX™ \$300 per copy, 8" diskette only.

For a free sample disassembly that'll convince you DYNAMITE+ is the world's best disassembler, send us your name, address, and the name of your operating system.

Order your DYNAMITE+ today!

See your local DYNAMITE+ dealer, or order directly from CSC at the address below. We accept telephone orders from 10 am to 6 pm, Monday through Friday. Call us at 314-576-5020. Your VISA or MasterCard is welcome. Orders outside North America add \$5 per copy. Please specify diskette size for FLEX or OS-9 versions.

Foreign Dealers:

Australia & Southeast Asia: order from Paris Radio Electronics, 161 Bunnerong Road (PO Box 380) Kingsford, 2032 NSW Australia. Telephone: 02-344-9111.

United Kingdom: order from Compusense, Ltd., PO Box 169, London N13 4HT. Telephone: 01-882-0681.

Scandinavia: order from Swedish Electronics AB, Murargatan 23-25, Uppsala S-754 37 Sweden. Telephone: 18-25-30-00.

COMPUTER EXCELLENCE, INC.

IS PROUD TO PRESENT A SUPERB
256K MEMORY SYSTEM
FOR THE SS-50 OR SS-50c BUS.

Now any 6800 or 6809 system can have up to a MEGABYTE
using our sophisticated new 256K memory system.

Runs full speed: 2MHz, no MRDY, no interrupts and still executes a refresh cycle. EVERY system 'E' clock. Works with any processor board, with or without 'DATs'. High-speed DATA on board, standard. Works with any SS-50 bus, with or without extended addressing lines. No cables or bus modifications. Board is QUIET: over 6 of ceramic decoupling capacitance. All gold bus connectors, fully socketed, solder masked. Does not use the double height sockets. Sockets are selective gold plated for reliability. Assembled, tested, ready to go. Ready to work with the 256K DRAMs when they become available. Use all the memory, including \$E000-\$F000: no useless banks. Memory management scheme compatible with SWTPC and GIMIX. Virtual disk drivers, memory diagnostics supplied with board. Software is on 5 inch, SS, SO, 35 track disk for FLEX. Provides up to 3,750 sectors of virtual disk storage at RAM speed. Requires less than 1.2 Amps from your systems +8 volt bus. Many configuration options.

And it's ready NOW! Shipped from stock!

Introductory price: \$749.00

Including software, users and maintenance manuals or send \$15.00 for users manual, applicable toward purchase price. COD, Cashier's check, personal checks must clear before shipment.

Florida residents add 5% sales tax.

4834 N.E. 12 AVE., FT. LAUDERDALE, FL 33334 (305) 782-8321

OS/9™, FLEX™, UNIFLEX™, IBM PC™ Software

SUPER SLEUTH DISASSEMBLER \$99-FLEX \$100-UNIFLEX \$101-OS/9

This program processes 6800/1/2/3/5/6/9 6502 programs, enabling the user to interactively analyze, modify, and disassemble (with labels) object code, with output to terminal, printer, and disk, and cross-reference and label-definition capabilities. Object-Only Version for Color FLEX \$50, COCO DOS \$99.

Z-80/8080/5 SUPER SLEUTH DISASSEMBLER \$99-FLEX \$100-UNIFLEX \$101-OS/9

This version of SUPER SLEUTH processes Z-80/8080/5 object code on the 6800/1/9.

CROSS-ASSEMBLERS each \$50 3/\$100-FLEX each \$60 5/\$120-UNIFLEX each \$55 3/\$110-OS/9

These programs and macros enable the user to process 6800/1, 6805, Z-80, 8080/5 programs in original format.

The TSC macro assembler is required for FLEX/UNIFLEX and the RMA assembler is required for OS/9.

[14]6805 and 6502 DEBUGGING SIMULATORS each \$75-FLEX \$80-UNIFLEX \$100-OS/9

These programs enable the user to interactively analyze, modify, and debug 1416805 and 6502 object code.

6502-TO-6809 XLATOR SYSTEM \$75-FLEX \$80-UNIFLEX \$85-OS/9

This program enables the user to translate 6502 assembler code into 6809 assembler code, noting inexact conversions.

6800-6809 & 6809 PIC XLATORS both \$50-FLEX \$60-UNIFLEX \$75-OS/9

These programs enable the user to translate 6800/1 assembler programs to 6809 mnemonics and to convert 6809 programs to position-independent code and data, using PC, S, U, X, and Y as base registers.

OS/9 and UNIFLEX SIMULATORS FOR FLEX each \$100-FLEX

The programs enable the user to debug OS/9 and UNIFLEX assembler programs using the TSC DEBUG and other facilities of FLEX.

DISK UTILITY PROGRAMS all \$50-FLEX

These programs enable the user to format/modify the SIR, to edit sectors, to test entire diskettes, to linearize the free list, to back up one disk to another, etc.

FULL SCREEN FORMS DISPLAY (6809 X-BASIC) \$50-FLEX \$75-UNIFLEX \$60-IBMPC

These programs enable the user to define and generate table driven full-screen display and data-entry programs.

FULL SCREEN MAILING LIST 6809 X-BASIC) \$100-FLEX \$110-UNIFLEX \$105-IBMPC

These programs enable the user to define and maintain mailing-list-oriented data bases.

FULL SCREEN INVENTORY/MRP (6809 X-BASIC) \$100-FLEX \$120-UNIFLEX \$110-IBMPC

These programs enable the user to define and maintain inventories, and include hierarchical material requirement planning.

TABULA RASA SPREADSHEET (6809 X-BASIC) \$100-FLEX \$125-UNIFLEX

These programs enable the user to generate and maintain tabular computation schemas, providing a simple user interface and sophisticated report-generation, similar to DESKTOP/PLAN (TM Desktop Computing).

TSC BASIC/XPC UTILITY PROGRAMS all \$25-FLEX \$50-UNIFLEX \$30-IBMPC

These programs enable the user to resequence or cross-reference any Basic program and generate XPC Basic sort programs.

Programs in source on disk - specify size, sides, density, type, computer, O/S.

Detailed printed manuals provided with all products.

For VISA and MASTER CARD give account, exp date, phone, US funds only - add 5% (10% foreign) for shipping.

Open Purchase Orders for D and B rated clients only. Call or write for catalog and dealer information.

GOOD NEWS!

C for the 6809 WAS NEVER BETTER!

INTROL-C/6809, Version 1.5

Introl's highly acclaimed 6809 C compilers and cross-compilers are now more powerful than ever!

We've incorporated a totally new 6809 Relocating Assembler, Linker and Loader. Initializer support has been added, leaving only bitfield-type structure members and doubles lacking from a 100% full K&R implementation. The Runtime Library has been expanded and the Library Manager is even more versatile and convenient to use. Best of all, compiled code is just as compact and fast-executing as ever - and even a bit more so! A compatible macro assembler, as well as source for the full Runtime Library, are available as extra-cost options.

Resident Introl-C/6809 compilers running under Flex or OS9 are priced from \$375; Uniflex, from \$425.

Cross-compilers for PDP-11/Unix hosts are priced from \$1500.

Trademarks:

Introl-C, Introl Corporation;
Flex and Uniflex, Technical Systems Consultants;
OS9, Microware Systems;
PDP-11, Digital Equipment Corp.;
Unix, Bell Labs.

For further information, please call or write.

Software

— DISASSEMBLERS —

Super Sleuth — Powerful, INTERACTIVE, Disassembler; provides Hex/ASCII Screen Dump of Memory Blocks or Disk Files for easy Examine/Change, Area Definitions; X-REF Generator of Source Code; change Address Labels to Names; etc. Disassembles 6800/1/2/3/5/8/9 and 6502 Code.

Color FLEX Obj. Only \$50.00, w/source \$99.00; FLEX \$99.00; UniFLEX \$100.00; OS-9 \$101.00

DYNAMITE + — An "easy to use" 6809 Disassembler for use w/ Disk Files, (will also disassemble 6800 Code). Develop a "Control File" of Area Definitions during successive disassemblies; X-Ref Source Files; replace Hex locations with Label Names; etc. Label Files provided for Mini-FLEX, FLEX2, FLEX9, FLEX and Color FLEX \$100.00 OS-9 \$150.00 UniFLEX \$300.00

— ASSEMBLERS —

TSC Macro Assembler — the FLEX STANDARD Assembler FLEX and Color FLEX \$50.00
TSC Reloc. Asmb./Link. Load. — Need for many of the C and Pascal Comp. FLEX & Color FLEX \$150.00

RRMAC — Relocating, Recursive Macro Assembler and Linking Loader for the 6809. Use either standard Motorola Format or Special Ed Smith Format. Supports Recursive Macros, Conditional Assembly, etc. Opt. X-Ref Listing; Includes a Small Line-oriented Editor as part of the Assembler. Greatly improved operating manual. FLEX and Color FLEX 6809 RRMAC w/Link and Editor \$150.00 w/Source, add \$50.00

OmegaSoft Relocatable Assembler and Linking Loader — 2-pass Reloc. Asmb; 2-pass Link. Load. Supports 6 Char. Labels, System Calls (SWI[x] FCB x), Expressions with Arith., Logic, and Shifts, etc. \$125.00 FLEX and Color FLEX \$125.00 (one year Maint. \$50.00)

MACE — (by Graham Trott) from WINDRUSH MICRO SYSTEMS. A combined Editor/Assembler designed to allow the Programmer to Enter, Edit, and Assemble Programs with a minimum of effort, w/o leaving the Program. X-MACE is a Cross Assembler for the MC6800/1/3 and Hitachi HD6301 (CMOS 6801) with the same functions and features as MACE. FLEX and Color FLEX - \$98.00

— A UniFLEX "basic" De-Compiler —

DUB — Re-Create a Source Listing from UniFLEX Compiled BASIC Programs. Easy to Use; works w/ ALL Versions of UniFLEX basic; Output to Disk or Term. Time TESTED and PROVEN; SOLID! UniFLEX \$219.95

— COMPILERS —

PL/9 — (by Graham Trott) from WINDRUSH MICRO SYSTEMS. A "Structured" Assembly Language Editor/Compiler/Debugger, all in ONE PACKAGE; provides a totally INTERACTIVE Program Development Cycle. The Compiler supports large Symbol Names, Variable Types, Pointers, Control Structures, Stack, A-, B-, and D-Register manipulation, etc. The Source oriented Trace/Debugger provides Single Stepping, Breakpointing, etc. An excellent Software Development Tool for utilizing the power of the 6809. FLEX and Color FLEX - \$198.00

C — (By James McQosh) from WINDRUSH MICRO SYSTEMS. SUPER C Compiler for the FLEX Operating System. Needs the TSC Relocating Assembler/Linking Loader for those "full blown" System Packages. FLEX and Color FLEX - 295.00

Introl 6809 "C" Compiler; generates very efficient object code. Output "benchmarks" close to 10MHz 68000 in 8 Bit Operations; 1.5 times faster than a 4 MHz 280 when using a 2MHz 6809 System (Re. p 43, "68" Micro Journal, May '83). Floats, etc. FLEX, Color FLEX, OS/9 \$375.00 UniFLEX \$425.00

— PASCAL —

TSC PASCAL — Native Code Compiler (UCSD Oriented). FLEX and Color FLEX \$200.00

Lucidata PASCAL — P-Code Compiler (ISO Standard). Designed especially for Microcomputer Systems; Run-time System checks available resources for each task, allowing operation on even minimal computer systems. Allows linkage to Assembler Code for maximum flexibility.

FLEX and Color FLEX 5" \$190.00 FLEX 8" \$205.00

OmegaSoft PASCAL — For the PROFESSIONAL; ISO Based, Native Code Compiler. For Real-Time and Process Control applications. Use custom I/O devices in place of the Pascal INPUT and OUTPUT; Long Int. (32 Bit); Dynamic length strings; Interrupt Processing, ROM-able, PIC, Re-Entrant Code, etc. POTENT!! Includes Source for the Symbolic Debugger, Runtime, and several Utilities. Requires a "Motorola Compatible" Relocating Assembler and Linking Loader.

Software

— A full, screen oriented, WORD PROCESSOR —
STYLOGRAPH 2.0 — (now run on the Data-Corp and FHL Color FLEX Systems; uses the 51 x 24 Display Screens). Full screen display and editing (i.e., what you see is what you get); supports the Daisy Wheel proportional printers.

SPECIAL Color FLEX STYLO \$195.00; FLEX and OS-9 STYLO \$295.00; UniFLEX STYLO \$395.00

Fast SPELLING CHECKER — allows directly changing the Text File, adding words to the dictionary, etc. 75,000 words in less than 400 sectors. **FLEX, Color FLEX, OS-9 \$125.00 UniFLEX \$175.00**

MAIL MERGE — greatly extends the power and flexibility of STYLOGRAPH. Allows Multiple Text files to be printed out as one large document. Provides for merging information into the Text file during printing (such as different names and addresses), etc.

FLEX, Color FLEX, OS-9 \$145.00 UniFLEX \$195.00

INFORMAG Data Base Management System — An XBASIC-based, Menu Driven, DBMS with "Built-In" Audit Tracking, Extremely Powerful Report & Format Capabilities, etc. This Time Proven DBMS will become the "Work Horse" of your Software Stable. **FLEX and Color FLEX \$295.00 UniFLEX \$395.00**

Accts Rec., Accts Payable & Gen Ledger — A FULL Accounting Package that can be used together, or as separate packages; provides the IRS required Audit Tracking. (XBASIC, based on the Osborne Business Programs.) **FLEX and Color FLEX \$295.00/PROG UniFLEX \$395.00/PROG**

An Electronic Spread Sheet

SYNACALC — THE Electronic Spread Sheet for 6009 Computer Systems. An extremely POWERFUL Business Tool, this Program will find an unlimited number of "non-business" applications, also (for example, I have just finished setting up a Full Junior College Electronics Curriculum using SYNACALC). Advanced features like "Table Lookup" make Income Tax work easy; Column or Row Sorting for numerous applications; etc. Completely "Memory Resident", Machine Language, this Program is FAST. Provides STANDARD FLEX Text File output for use with BASIC, Word Processors, Pascal, "C", etc.

FLEX and SPECIAL Color FLEX (Both FHL and Data-Corp) \$200.00 UniFLEX \$395.00

Machine Language DATA BASE MANAGEMENT System

Westchester Applied Business Systems XDBMS Data Management Systems. Possibly one of the most powerful DMS's available, this machine language program is small enough to operate on a single sided 5" disk, yet provides the speed of M.L. and power limited only by the user's imagination. Supports Sequential, Hierarchical, and Random Access File Structures, and has Virtual Memory capabilities for those Giant Data Bases. Easy-to-use English Language Command Structure.

XDBMS — FLEX and Color FLEX \$179.95 XDBMS+ — FLEX and Color FLEX \$250.00

Software

SPELLB "Computer Dictionary" —— OVER 120,000 words!

No more "Let your fingers do the walking through the Dictionary" while you are inputting Text with your favorite Editor or Word Processor. **SPELLB** is more than "another Spelling Checker"; it allows you to look up a word from within your Editor or Word Processor so that you KNOW it is right WHEN YOU TYPE IT IN with the **SPEL.CMD** Utility (which operates in the FLEX Utility Space). Yes, it ALSO allows you to check and update the Text after you are finished; along with allowing you to ADD WORDS to the Dictionary, "Flag" questionable words in the Text for evaluation later, "View a word in context" before changing or ignoring, etc. **SPELLB** first checks a "Common Word Dictionary", then the normal Dictionary, then a "Personal Word List", and finally, any "Special Word List" you may have specified. **SPELLB** also allows the use of **Small Disk Storage** systems.

FLEX and Color **FLEX** \$129.95

JUST — a Text Formatter

JUST, a Text Formatter developed by Ron Anderson, provides numerous features which make it a valuable addition to any **FLEX** Users Software Library. **JUST** is designed for formatting Text Output for **Dot Matrix Printers** and provides many unique features:

- Output the "Formatted" Text to the Display for format analysis and change.
- Output the "Formatted" Text to a Text File for use with the **supplied PPRIET.CMD** for producing multiple copies of the Text on the Printer **INCLUDING IMBEDDED PRINTER COMMANDS** (this Utility is very useful at other times also, and worth the price of the program by itself).
- "User Configurable" for adapting to other Printers (comes set up for Epson MX-80 with Graftrax); provides for up to ten (10) imbedded "Printer Control Commands", such as Italics on and off, boldface on and off, etc.
- Automatic compensation for a "Double Width" printed line.
- Includes the normal line width, margin, indent, paragraph, space, vertical skip lines, page length, page numbering, centering, fill, justification, etc.
- Use with **ANY** Editor.
- Supplied with "Structured Source" (Windrush PL/9); easy to see the flow of the program.

FLEX and Color **FLEX** \$49.95

SPECIAL! SPECIAL! SPECIAL!

Star-Kits excellent **SPELL 'N FIX** Dictionary and **WRITE 'N SPELL** Word Look Up Program IN ONE PACKAGE;
FLEX and Color **FLEX** Systems — BOTH for ONLY \$159.95
When these are gone; the price goes UP!! WAY UP!! ORDER NOW!!

Also, call for "More Info" on both the **FLEX** Based and Color Computer Based **STAR-KITS** Products; including the **HUMBUG** Monitor, **Check 'N Tax** Program, **REMOTERM** Color Computer External Terminal Program, etc.

PASCAL UTILITIES — Requires **LUCIDATA Pascal** ver 3.

XREF — produce a Cross Reference Listing of any text; oriented to Pascal Source.
INCLUDE -- allows the inclusion of other Files in a Source Text; has unlimited nesting capabilities. Also allows Binary File inclusions.
PROFILER -- produces an Indented, Numbered, "Structogram" of a Pascal Source Text File. Allows viewing the overall structure of large programs, and provides clues as to the integrity of the program. Supplied as Source Code; requires compilation.

FLEX and Color **FLEX** — Each program \$25.00

COPYCAT -- (Pascal NOT required) Allows reading TSC Mini-FLEX, SSB 0068, and Digital Research CP/M Disks while operating under **FLEX** 1.0, **FLEX** 2.0, or **FLEX** 9.0 with 6800 or 6809 Systems. **COPYCAT** will not perform Miracles, but, between the program and the manual, you stand a good chance of accomplishing a transfer. Includes Utilities to List Directories, Copy Files, and convert Text Files when required. Also includes a Utility for investigating Physical Compatibility problems. Programs supplied in Modular Source Code to make it easier to solve unusual problems.

FLEX and Color **FLEX** 5" \$50.00 **FLEX** 8" \$65.00

Software

O-F — OS/9 to FLEX — FLEX to OS/9 —

Finally, the barrier has been removed between OS/9 and FLEX formatted disks! Now you can READ from, and WRITE to, a Single Sided 5" or 8" FLEX diskette from OS-9 with O-F. O-F is a new and unique program, written in BASIC89 (with Source), that performs the following functions:

REFORMAT: A BASIC89 Program that reformats a chosen amount of an OS-9 disk to FLEX Format so it can be used normally by FLEX.

FLEX: A BASIC89 Program that does the actual read or write function to the special O-F Transfer Disk, all selectable from a user-friendly menu. Functions provided include reading the FLEX Directory, Deleting FLEX Files, Copying both directions, etc. All selections are interactive and complete, including all necessary prompts to the operator.

FLEX users can read, write and use the special disk as any other FLEX disk, provided the FLEX directory is not allowed to continue beyond track zero (too many files).

FLEX and Color FLEX \$79.95

COPYMULT.CMD — Copy LARGE Disks to several smaller disks —

The following FLEX utilities allow the backup of ANY size disk to any SMALLER size diskettes (Winchester to 8's or 5's, 8" to 5's, etc.). By simply inserting diskettes as requested by COPYMULT, a large disk system may be downloaded to your present floppy disk system, any size. No need to fiddle with directory deletions or any of the other tedious operations that must be done using the normal copy routines.

COPYMULT.CMD understands normal "copy" syntax and always keeps up with files already copied by maintaining directories for both host and receiving disk system, eliminating hours of tedious keyboard entries and other time consuming cleanup chores.

BACKUP.CMD is a special program that downloads "random" type files, any size.

RESTORE.CMD a special program to restructure copied "random" files for copying, or recopying back to the host system.

FREELINK.CMD a "bonus" utility that "relinks" the free chain of floppy or hard disk thereby eliminating fragmentation.

Completely documented source files included. ALL 4 Programs \$99.50 (8" or 5")

CHESS 6899

Requires FLEX and DISPLAYS On Any Type Terminal

Features:

- *Two display boards. *Change skill level. *Swap side. *Point scoring system.
- *Four levels of play. *Solve Checkmate problems in 1-2-3-4 moves.
- *Make move and swap sides. *Play white or black.

This is one of the strongest CHESS programs running on any microcomputer, estimated USCF Rating 1600+ (better than most 'club' players at higher levels).

FLEX and Color FLEX \$79.95

DIET-TRAC Forecaster

DIET-TRAC Forecaster is an XBASIC program that plans a diet in terms of either calories and percentage of carbohydrates, protein and fats (C P G%) or grams of Carbohydrate. Protein and Fat food exchanges of each of the six basic food groups (vegetable, bread, meat, skim milk, fruit and fat) for a specific individual.

Sex, Age, Height, Present Weight, Frame Size, Activity Level and Basal Metabolic Rate for normal individual are taken into account. Ideal weight and sustaining calories for any weight of the above individual are calculated. When a weight goal is given (either gain or loss), and a calorie plan is agreed upon between the computer and the individual, the number of days to reach the weight goal is projected. The starting and ending rate of weight loss is calculated, and a daily calendar with each day's weight for a 30-day period is printed.

FLEX - \$59.95 UniFLEX - \$89.95

XDATA — A COMMUNICATION Package for the UniFLEX Operating System —

Allows UniFLEX Based Systems to Transmit and Receive files to and from other Computer Systems via Modem. Use with CP/M, Main Frames, other UniFLEX Systems, etc.

- Verifies Transmission integrity using checksum or CRC
- Automatically Re-Transmits bad blocks
- Transmits data in 128 byte blocks

UniFLEX \$299.99

AT LAST!! A FULL BLOWN DISASSEMBLER FOR THE COLOR COMPUTER
Computer Systems Consultants SUPER SLEUTH is a "Time Tested", reliable, PROVEN Disassembler that has gained acceptance through out the FLEX Community as an extremely POWERFUL, INTERACTIVE, Software Tool. Now, this powerful Disassembler has been converted to run on a Standard 32K Color Computer or TDP-100 System with a Disk System. The Coco SLEUTH Software Package consists of 3 Programs; SLEUTH (the Disassembler), CHGNAM (used to globally Change Labels to a meaningful Name), and XREF (a Cross Reference Generator for Source Code Files). Coco SLEUTH will Disassemble Disk Files of 6800, 6801, 6802, 6803 (the "Baby Coco"), 6805, 6808, 6809, and 6502 (Apple, Atari, Commodore, etc.) Object Code if you can get it on a Color Computer Disk. (See Aug. '83 '88' Micro Journal "Color Users Notes" Column for a full Review.)

Color Computer Disk - Object Code Only \$49.00

FORTH Programming Language

Stearns Electronics FORTH -- Intrigued by Forth?? Here is a Forth package tailored to the Color Computer! This package is supplied on Tape, with instructions for transferring it to disk if you wish. Written primarily in machine language, it's speed is unparalleled. A full Semigraphic-8 Editor is provided, along with "goodies" like Graphics and Sound Commands, Printer Commands, Auto-Repeat and Control Keys, etc. If you are interested in Learning Forth, a Trace Feature is provided which is invaluable. If you are a FORTH Pro, this package provides CPU carry Flag accessibility, Fast Task Multiplexing, Clean Interrupt Handling, etc. (Or; you won't "out grow" the Basic capabilities of this Implementation). Combine this package with Leo Brodie's EXCELLENT Book "Starting FORTH", and you will be a FORTH Expert before you know it (and have a lot of fun doing it!).

Color Computer TAPE (w/ instructions for transferring to Disk) \$58.95

Color Computer GRAPHIC SCREEN PRINT Programs

Dumps any "PMODE" Screen to the Printer with the BASIC USR Function. Shift the Printout Left or Right or Reverse Print (Dark for Light Screen and Vice Versa). All Programs on Tape.

GSPP for Radio Shack LP-VII/VIII & DMP 100/200/400 Printers \$7.95

GSPP for Epson w/ Graftrax and Graftrax + Printers 9.95

GSPPG for Gemini 10 and 15 Printers 9.95

GSPPP for the Prowriter Printers 9.95

DATE-O-BASE CALENDAR Program

A Menu Driven EXTENDED BASIC Program which allows the entry of up to 12 Memos per Day, each of which may contain up to 28 Characters, for any day of the Month between the years 1700 and 2099. A Graphic Calendar shows which days contain Memos, and a "Key Word" Search is provided which can be output to the Screen or Printer.

TAPE DATE-O-BASE CALENDAR (Each Tape File will hold up to 400 Memos) \$16.95

DISK DATE-O-BASE CALENDAR (4,000 Memos at 300/Month per Disk) 19.95

Interested in INTEREST (the Money Kind)?

An EXTENDED BASIC Program that will help you deal with numerous problems requiring interest calculations. Present Value, Rate of Return, Current Bond Yield and Rate of Return to maturity, Loan Repayment Amortization Schedules, etc.

TAPE \$29.95

Data Base Management System

DISK DATA HANDLER 64K - EXTENDED BASIC w/ Mach. Lang. Routines. Allows a max of 246 Chars. and 14 Fields per Record, and another Record can be linked to the first; 8 Char. Field Names, up to 99 Chars. per Field. Powerful On-Screen editor for input and update, flexible Output capabilities including output to Disk Files for use by other Programs. Change File Definition without re-entering the Data, Split Files, etc. Allows Multiple Field Sorts, Select on any combination of Fields, etc. An extremely POWERFUL TOOL; instructions provide examples of Mailing Lists and a Financial Stock Profit and Loss Tracking System.

DISK \$54.95

ACCOUNTING

DISK DOUBLE ENTRY - DISK EXTENDED BASIC w/ Mach. Lang. Routines. A "Traditional" Accounting Package for Small Business, Clubs, Churches, Personal Use, etc. Up to four levels of subtotals with Trial Balance, Income Statement, and Balance Sheet Reports. DDE allows up to 300 accounts and a Trial Balance of \$9,999,999.99. Transactions may be up to 14 lines long, and comments and explanations may be freely used. Accounts are traceable to the journal transaction, which may include comments. Screen reports allow review of past transactions and current balances.

DYNAshare --- Multi-User, Multi-Tasking with **FLEX**

Software

Southeast Media is now shipping **DYNAshare** FROM STOCK - the multi-user, multi-tasking capability of **DYNAshare** allows **FLEX** users the advantages of more sophisticated and time saving computer usage without having to buy or learn a new language or Operating System syntax. **DYNAshare**, as its name implies, allows true "time-sharing" operation under the popular **FLEX** operating system, and also allows each user to run two simultaneous jobs (multi-tasking); even on single-user systems. For example, while in **EDIT**, you can list another file or examine a directory. Or, you might look up an item in a Data Base while a Sort is in progress! **DYNAshare** also provides some fringe benefits that will be greatly appreciated by **FLEX** users, including type-ahead, command line editing, and instant response to "escape".

DYNAshare is the painless method! Use your existing **FLEX** computer by simply adding 64K of RAM for each user. Fact is, you still use **FLEX** just like you always have! **DYNAshare** is not intended as competition to **UniFLEX**. It does not improve on the speed of **FLEX**, and does not offer password protection or other niceties of a full-blown multi-user system. What **DYNAshare** does do is give **FLEX** users a low-cost way to use existing software in a multi-user, multi-tasking environment, so your existing **FLEX** versions of **BASIC**, **XBASIC**, editors, assemblers, disassemblers, sort/merge packages, word processors, compilers, **SYNACALC** spread-sheet package, and so on are still good.

NOTE -- The initial release of **DYNAshare** is for **SMPC S/09** Computers, but versions will also be available for other popular extended-memory (up to 1624K) systems, such as **HELIx** and **GIMIX**. A minimum of 128K of RAM will be required with ALL versions. **DYNAshare** requires 64K of RAM for each active task; thus a 256K system could allow foreground-background operation on two terminals, or foreground-only operation on four terminals.

AVAILABLE NOW from **SOUTHEAST MEDIA** — \$200.00

— **AUTHORS - PROGRAMMERS** —— **QUALITY SOFTWARE NEEDED** —
FLEX - UniFLEX - OS/9 - Color Computer

For the past several months, we at the Southeast Media Division of Computer Publishing, Inc. (CPI), the parent company of '68' **MICRO JOURNAL** and **COLOR MICRO JOURNAL**, have debated expanding our software distribution business. Many other magazines have been doing so for years (in fact, MOST were in the Software Distribution Business BEFORE they began to publish a Magazine). Presently there are many fine examples of software that has been developed by YOU, our readers, that will never see the "light of day" due to the cost of Advertising and TIME and cost involved in the production, distribution, and Customer SUPPORT of that software unless SOMEONE, with enough exposure and the willingness to continually advertise, runs with the ball.

Software is the "backbone" for the REAL utilization of any Computer System, and ours are no exception! This has been no simple decision. While we realize that there could be some conflict with some of our advertisers, we ALSO hear a LOUD and CONTINOUS cry for HELP from our Readers. From day one, the ~~foremost concern~~ of '68' **MICRO JOURNAL** has been it's READERS! Therefore, our Southeast Media Division will accept, for appraisal for possible Distribution, 6809 software; Games, Utilities, Software Development, Business Application Programs, etc.

In the past there has been too much software offered that was not quite ready. We will strive to eliminate that element. But, right up front, we tell you only that we will do our very best; nothing more. Also, we will strive to keep cost to a bare minimum, while securing for the author a fair return in royalty payments, promptly paid, and in customer support for his product.

Of course, we will expect, no -- ~~DEMAND~~, that the author keep the product free of errors (bugs), and maintain it in a prompt and business like manner. Also we shall require that authors be willing to furnish 'source' for those programs that justify, by price and utility, inclusion of same. The lack of source code, properly commented, is a continual complaint we hear. Not all programs will be sold with source, but where necessary, we will insist that it be included.

In some instances the program may be small or short and not justify itself as a "single" sale product. In this event it will be combined with other like programs, and offered as a package. In that event, the royalties will be split between the various authors.

If you have software that you feel will qualify under this program, please contact one of the people below. Remember, if your software has any problems or "funnies" -- **GET IT STRAIGHT BEFORE YOU CONTACT US!** Also get your source code in proper shape and well commented; there is too much 99% code already drifting around.

If your software is **READY** contact: Bob Bay, Don Williams, or Tom Williams

Southeast Media is a division of Computer Publishing, Inc. (CPI),
a family of 100% 6809 support facilities.

SORTC** for OS9*

THE ONE AND ONLY

LIKE THIS:

NOT LIKE THIS

BOLDLY GOING WHERE NO SORT HAS GONE BEFORE

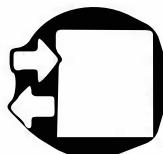

SORTC is a high speed, full-record compounding disk sort, which gives microcomputer users mainframe capabilities. It has been specifically designed to sort data efficiently while offering the user great flexibility in designing sort programs. It is written in BASIC09* for use under OS9.

COMPOUNDING FUNCTION

SORTC has the capability of summing user-specified numeric fields on equality of keys. This allows significant savings in memory, disk space, and program development time. A reduction in the number of disk accesses required when compared to other sorts is inherent in the design of SORTC.

DISK BASED

Specifically designed to sort large volumes of data, SORTC imposes no size restrictions on the amount of data to be sorted. It also places no limits on the number of sort keys which can be used or the order in which the keys are sorted. Furthermore, the sort procedure can be performed as many times as necessary within the same program. This feature allows the programmer to take advantage of any existing data bias, and possibly even reduce the size of the sort key.

JBM'S MIDWARE

*OS9, BASIC09 are registered trademarks of Microware Corporation.

**Uses the same algorithm as JBM's SORTC for Digital Equipment Corp. RSTS Systems.

ADVANCED DESIGN

While most disk sorts are partially based upon the Fibonacci series, SORTC is not. SORTC is a generation ahead of the normal sorts based upon the "Fib series". Its unique algorithm is automatically optimized at run time for a reduction in workspace, reduced # of disk accesses and shorter run times. Designed to be as "crash proof" as possible, the sort procedure will not abort if it is accidentally asked to sort zero items.

EASY TO USE

It is not difficult to design a program which will use JBM's SORTC. Since SORTC is a subroutine, the user may write any procedure he or she wants to format the data for sorting and then to process the sorted data. The sorted data need not be written back to disk, but instead is immediately available. The sort code is automatically inserted into the source procedure by a simple Sort Generator.

ORDERING INFORMATION

SORTC, from JBM's MIDWARE line of quality software, is available on either five and one-quarter or eight inch diskettes for a price of \$150.00. All of JBM's software packages come complete with comprehensive user's manuals.

ISAIAH 9 -

2 The people that walked in darkness have seen a great light: they that dwell in the land of the shadow of death, upon them hath the light shined.

6 For unto us a child is born, unto us a son is given: and the government shall be upon his shoulder: and his name shall be called Wonderful, Counselor, The mighty God, The everlasting Father, The Prince of Peace.

LUKE 2 -

1 And it came to pass in those days, that there went out a decree from Caesar Augustus, that all the world should be taxed.

2 (And this taxing was first made when Cyrenius was governor of Syria.)

3 And all went to be taxed, every one into his own city.

4 And Joseph also went up from Galilee, out of the city of Nazareth, into Judaea, unto the city of David, which is called Bethlehem; (because he was of the house and lineage of David:)

5 To be taxed with Mary his espoused wife, being great with child.

6 And so it was, that, while they were there, the days were accomplished that she should be delivered.

7 And she brought forth her firstborn son, and wrapped him in swaddling clothes, and laid him in a manger; because there was no room for them in the inn.

8 And there were in the same country shepherds abiding in the field, keeping watch over their flock by night.

9 And, lo, the angel of the Lord came upon them, and the glory of the Lord shone round about them: and they were sore afraid.

10 And the angel said unto them, Fear not: for, behold, I bring you good tidings of great joy, which shall be to all people.

11 For unto you is born this day in the city of David a Saviour, which is Christ the Lord.

13 And suddenly there was with the angel a multitude of the heavenly host praising God, and saying,

14 Glory to God in the highest, and on earth peace, good will toward men.

We would like to take the opportunity to thank all of our customers, associates and friends for their support over the past years, and to pray a special blessing for each and every one of you in the years to come.

***** ALFORD AND ASSOCIATES, P.O. BOX 6683, RICHMOND, VIRGINIA, 23230 - PHONE 804-320-6722 *****

ISAIAH 53 -

1 Who hath believed our report? and to whom is the arm of the Lord revealed?

2 For he shall grow up before him as a tender plant, and as a root out of a dry ground: he hath no form nor comeliness; and when we shall see him, there is no beauty that we should desire him.

3 He is despised and rejected of men; a man of sorrows, and acquainted with grief: and we hid as it were our faces from him; he was despised, and we esteemed him not.

4 Surely he hath borne our griefs, and carried our sorrows: yet we did esteem him stricken, smitten of God, and afflicted.

5 But he was wounded for our transgressions, he was bruised for our iniquities: the chastisement of our peace was upon him; and with his stripes we are healed.

6 All we like sheep have gone astray; we have turned every one to his own way; and the Lord hath laid on him the iniquity of us all.

7 He was oppressed, and he was afflicted, yet he opened not his mouth: he is brought as a lamb to the slaughter, and as a sheep before her shearers is dumb, so he openeth not his mouth.

8 He was taken from prison and from judgement: and who shall declare his generation? for he was cut off out of the land of the living: for the transgression of my people was he stricken.

9 And he made his grave with the wicked, and with the rich in his death; because he had done no violence, neither was any deceit in his mouth.

10 Yet it pleased the Lord to bruise him; he hath put him to grief: when thou shalt make his soul an offering for sin, he shall see his seed, he shall prolong his days, and the pleasure of the Lord shall prosper in his hand.

11 He shall see the travail of his soul, and shall be satisfied: by his knowledge shall my righteous servant justify many; for he shall bear their iniquities.

12 Therefore will I divide him a portion with the great, and he shall divide the spoil with the strong; because he hath poured out his soul unto death: and he was numbered with the transgressors; and he bare the sin of many, and made intercession for the transgressors.

CHRISTMAS SALE

Make a loved one happy by giving yourself a Star-Kits program for Christmas. It's easy with these special prices until December 24th.

SPELL 'N FIX for 6809 Flex, normally \$178.58, on sale for \$125. Other SS-50 versions, normally \$89.29, now \$75. (And if you didn't know, Flex is a trademark of Technical Systems Consultants, who asked us to tell you.)

WRITE 'N SPELL, normally \$75.11, now \$60 alone or \$30 when ordered with **SPELL 'N FIX**.

HUMBUG ON DISK. This fantastic debugger runs as a utility under either Flex or STAR-DOS 64, especially useful for 6809 Flex on the Color Computer! Regularly \$59.95, now \$49.95.

HUMBUG in ROM for SS-50 systems reduced \$10; send for spec sheet for versions available.

STAR-DOS 64 disk operating system for the Color Computer, normally \$74.90 now \$49.90.

We accept checks, COD, MasterCard, or Visa. NY Residents please add appropriate tax. Have a Merry Bah Humbug.

TEN MOST-ASKED QUESTIONS about DYNACALC™

THE ELECTRONIC SPREAD-SHEET FOR 6809 COMPUTERS

1. What is an electronic spread-sheet, anyway?

Business people use spread-sheets to organize columns and rows of figures. DYNACALC simulates the operation of a spread-sheet without the mess of paper and pencil. Of course, corrections and changes are a snap. Changing any entered value causes the whole spread-sheet to be re-calculated based on the new constants. This means that you can play 'what if?' to your heart's content.

2. Is DYNACALC just for accountants, then?

Not at all. DYNACALC can be used for just about any type of job. Not only numbers, but alphanumeric messages can be handled. Engineers and other technical users will love DYNACALC's sixteen-digit math and built-in scientific functions. You can build worksheets as large as 256 columns or 256 rows. There's even a built-in sort command, so you can use DYNACALC to manage small data bases — up to 256 records.

3. What will DYNACALC do for ME?

That's a good question. Basically the answer is that DYNACALC will let your computer do just about anything you can imagine. Ask your friends who have VisiCalc™, or a similar program, just how useful an electronic spread-sheet program can be for all types of household, business, engineering, and scientific applications. Typical uses include financial planning and budgeting, sales records, bills of material, depreciation schedules, student grade records, job costing, income tax preparation, checkbook balancing, parts inventories, and payroll. But there is no limit to what YOU can do with DYNACALC.

4. Do I have to learn computer programming?

Not! DYNACALC is designed to be used by non-programmers, but even a Ph.D. in Computer Science can understand it. Even experienced programmers can get jobs done many times faster with DYNACALC, compared to conventional programming. Built-in HELP messages are provided for quick reference to operating instructions.

5. Do I have to modify my system to use DYNACALC?

Nope. DYNACALC uses any standard 6809 configuration, so you don't have to spend money on another CPU board or waste time learning another operating system.

Order your DYNACALC today!

Foreign Dealers:

Australia & Southeast Asia: order from Paris Radio Electronics, 161 Bunnerong Road (PO Box 380) Kingsford, 2032 NSW Australia. Telephone: 02-344-9111.

United Kingdom: order from Compusense, Ltd., PO Box 169, London N13 4HT. Telephone: 01-882-0681.

Scandinavia: order from Swedish Electronics AB, Murargatan 23-25, Uppsala S-754 37 Sweden. Telephone: 18-25-30-00.

6. Will DYNACALC read my existing data files?

You bet! DYNACALC has a beautifully simple method of reading and writing data files, so you can communicate both ways with other programs on your system, such as the Text Editor, Text Processor, Sort/Merge, STYLOGRAPH™ word processor, RMS™ data base system, or other programs written in BASIC, C, PASCAL, FORTRAN, and so on.

7. How fast is DYNACALC?

Very. Except for a few seldom-used commands, DYNACALC is memory-resident, so there is little disk I/O to slow things down. The whole data array (worksheet) is in memory, so access to any point is instantaneous. DYNACALC is 100% 6809 machine code for blistering speed.

8. Is there a version of DYNACALC for MY system?

Probably. You need a 6809 computer (32k minimum) with FLEX™, UNIFLEX™, or OS-9™ operating system. You also need a decent crt terminal, one with at least 80 characters per line, and direct cursor addressing. If your terminal isn't smart enough for DYNACALC, you probably need a new one anyway. The UNIFLEX and OS-9 versions of DYNACALC allow you to mix different brands of terminal on the same system. There's also a special version of DYNACALC for Color Computers equipped with FLEX (Frank Hogg or Data-Comp versions).

9. How much does DYNACALC cost?

The FLEX versions are just \$200 per copy; UNIFLEX version S395; OS-9 version (works with LEVEL ONE or LEVEL TWO) \$250. Orders outside North America add \$7 per copy for postage. We encourage dealers to handle DYNACALC, since it's a product that sells instantly upon demonstration. Call or write on your company letterhead for more information.

10. Where do I order DYNACALC?

See your local DYNACALC dealer, or order directly from CSC at the address below. We accept telephone orders from 10 am to 6 pm, Monday through Friday. Call us at 314-576-5020. Your VISA or MasterCard is welcome. Please specify diskette size for FLEX or OS-9 versions. Software serial number is required for the UNIFLEX version.

Calendar - Clock

CLK68-1

- Shows date and time whether or not the computer is on
- All alarm functions fully controllable
- No zero between calendar and calendar results from the month
- Day of week, month/year, day/year, next weekend (11/17/81) etc.

Interval Timer

- For timer enabled, auto-timering, etc.
- Compatible with S80 and DOG
- 0.1 sec. to 1 sec. with 0.01 sec. steps with times such as 39.99 sec. etc.
- Generates interrupt intervals from 1.44 microseconds to 256 sec.

Parallel I/O Port

— Fully buffered 8-bit parallel port

- DIP switches select input or output addressing (no jumpers on the board)
- Compatible with parallel printer outputs in most versions of BASIC

Construction

— Fully potted, solder sealed, & silk screened

Manual

— Well documented - 36 pages

WINDRUSH MICRO SYSTEMS

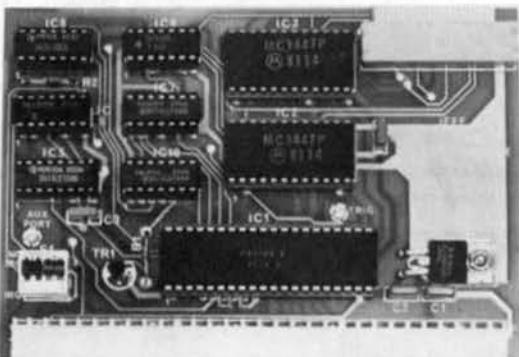

UNIVERSAL EPROM PROGRAMMER

- PROGRAMS and VERIFIES 2508, 2708, 2516, 2716, 2532, 2732A, 2564, and 2764 EPROMS. Minuscule hardware modifications are required to program the INTEL 27128.
- Tri-volt and Single Volt 2508/2708 and 2516/2716 devices are supported.
- 21F sockets with mode selector switches eliminate 'personality modules'.
- Twin boards with five feet of twisted pair planer cable puts the programmer out on the bench where it belongs.
- SS-30 and EXORciser™ interfaces are available.
- Menu driven software provides the following facilities:
 - MOVE blocks of memory within the buffer.
 - READ an EPROM into the buffer.
 - VERIFY an EPROM against the buffer.
 - EXAMINE and change the contents of the buffer.
 - DISPLAY the contents of the buffer in HEX and ASCII.
 - FILE a selected area of the buffer with a specified character.
- Software available for all versions of SS-909, TLEZ 2, FLEX 9 and 98-9. Assembly language source files supplied on disk...enables customizing.
- Well documented users manual provides step-by-step adaptation and operating instructions.

AVAILABLE FROM GMIX IN THE U.S.A.

IEEE-488

- SUPPORTS ALL PRINCIPAL MODES OF THE IEEE-488 (1975/8) BUS SPECIFICATION:**
 - Father
 - Listener
 - System Controller
 - Serial Poll
 - Parallel Poll
 - Group Trigger
 - Single or Dual Primary Address
 - Secondary Address
 - Talk only...Listen only
- Fully documented with a complete reprise of the KILABAU article on the IEEE bus.
- Low level assembly language drivers suitable for 6800, 6801, 6802, 6803, 6808 and 6809 are supplied in the form of listings. These drivers have been extensively tested and are **GUARANTEED** to work!
- Single SS-30 board (4, 8, or 16 addresses per port), fully socketed, gold plated bus connectors, and IEEE interface cable assembly.

PL/9 EDITOR/COMPILER/DE-BUGGER

- Friendly interactive environment where you have INSTANT access to the Editor, the Compiler, and the Trace-Debugger, which, amongst other things, can single step the program SOURCE line at a time. You also have direct access to any FLDI utility and your System Monitor.
- 250 page manual is organized as a tutorial with plenty of examples.
- Fast single pass compiler produces 8K of COMPACT and FAST 6809 machine code output per minute with no run-time overheads or license fees.
- Fully compatible with TSC text editor format disk files.
- Signed and unsigned BYTES and INT16BBS, 32-bit floating point REALs.
- Vectors (single dimension arrays) and Pointers are supported.
- Mathematical expressions: (), (), (), modulus (), negation ()
- Expression evaluators: (), (>), (<), (>=), (<=), (=)
- Bit operators: (AND), (OR), (BOR), (BDE), (BNOT), (BSHFT), (SWAP)
- Logical operators: (.AND), (.OR), (.EOR) (.NOR)
- Control statements: IF..THEN..ELSE, IF..CASE1..CASE2..ELSE, BEGIN..END, WHILE..REPEAT..UNTIL, REPEAT..FOREVER, CALL, JUMP, RETURN, BREAK, GOTO.
- Direct access to (AEEA), (ACCE), (FACC), (CCR) and (XREG).
- FULLY supports the MC6809 SH1, SH12, SH13, SH14, F10, I10 and RESET vectors. Writing a self-starting (from power-up) program that uses ANY, or ALL, of the MC6809 interrupts is an absolute snap!
- Procedures may be passed and may return variables. This makes these functions which behave as though they were an integral part of PL/9.
- Several fully documented library function modules are supplied: TOSLIB, BITLIB, MARIO, MEXLIB, FLXLIB, SCIPAGE, STDSLIB, and REALCON.

'... THIS IS THE MOST EFFICIENT COMPILER I HAVE FOUND TO DATE.'

Quoted from Ron Anderson's FLEX User Notes column. Need we say more?

WE STOCK THE FOLLOWING COMPANIES PRODUCTS:
GMIX, SSB, FHL, MICROWARE, TSC, LUCIDATA, AND ALFORD & ASSOCIATES.

FLEX™ is a trademark of Technical Systems Consultants, SS-9™ is a trademark of Microware Systems Corporation, MC6809™ and EXORciser™ are trademarks of Motorola Incorporated.

MACE/XMACE

A co-resident EDITOR/ASSEMBLER for the 6809 written by Graham Trott which takes most of the pain out of assembly language program development.

- Friendly interactive environment where you have INSTANT access to the Editor, the Assembler, FLEX and your System Monitor.
- MACE can also produce ASMPROC's for PL/9 with the assembly language source passed to the output file as comments.
- Includes XMACE a co-resident 6800/1/2/3/8 EDITOR/CROSS ASSEMBLER.

This is the TLEZ version of the James McCaff 'C' compiler that is also available on UNIFLEX from SUTP and SS-9 from Microware.

- The PL/9 implementation supports the full Kernighan and Ritchie 'C' specification except 'floats', 'doubles', and 'bit-fields'.
- Produces very efficient assembly language source output with the 'C' source optionally interleaved as comments.
- Built-in optimizer will shorten object code by about 11%.
- Supports interleaved assembly language programs.
- The TSC relocating assembler/linking loader (SPOF-17) is REQUIRED.

THE COMPACTA UNIBOARD™: Through special arrangement with COMPACTA INC., we are proud to have been selected the exclusive U.S. Mfg. of their new 6809 UNIBOARD™ COMPUTER KIT. Many software professionals feel that the 6809 features probably the most powerful instruction set available today on ANY 8 bit micro. Now, at last, all of that immense computing power is available at a truly unbelievably low price.

FEATURES:

- ★ 64K RAM using 4116 RAMS.
- ★ 6809E Motorola CPU.
- ★ Double Density Floppy Disk Controller for either 5-1/4 or 8 inch drives. Uses WD1793.
- ★ On board 80 x 24 video for a low cost console. Uses 2716 Char. Gen. Programmable Formats. Uses 6845 CRT Controller.
- ★ ASCII keyboard parallel input interface. (6522)
- ★ Serial I/O (6551) for RS232C or 20 MA loop.
- ★ Centronics compatible parallel printer interface. (6522)
- ★ Buss expansion interface with DMA channel. (6844)
- ★ Dual timer for real time clock application.
- ★ Powerful on board system monitor (2732). Features commands such as Go To, Alter, Fill, Move, Display, or Test Memory. Also Read and Write Sectors. Boot Normal, Unknown, and General Flex™.

FEATURES:

- ★ Uses new 2K x 8 (TMM 2016 or HM 6116) RAMs.
- ★ Fully supports Extended Addressing.
- ★ 64K draws only approximately 500 MA.
- ★ 200 NS RAMs are standard. (TOSHIBA makes TMM 2016s as fast as 100 NS. FOR YOUR HIGH SPEED APPLICATIONS.)
- ★ Board is configured as 3-16K blocks and 8-2K blocks (within any 64K block) for maximum flexibility.
- ★ 2716 EPROMs may be installed anywhere on Board.
- ★ Top 16K may be disabled in 2K blocks to avoid any I/O conflicts.
- ★ One Board supports both RAM and EPROM.
- ★ RAM supports 2MHZ operation at no extra charge!
- ★ Board may be partially populated in 16K increments.

16K STATIC RAMS?

CLOSE OUT SPECIAL
WE HAVE DROPPED OUR 32K SS-50 STATIC RAM BOARD WHICH USED 2114 LOW POWER RAMS. WE WILL SELL THE REMAINING STOCK OF BLANK PCB'S WITH DATA FOR \$17.50 EA. THESE FORMERLY SOLD FOR \$50.

The new 2K x 8. 24 PIN. static RAMs are the next generation of high density, high speed, low power, RAMs. Pioneered by such companies as HITACHI and TOSHIBA, and soon to be second sourced by most major U.S. manufacturers, these ultra low power parts, feature 2716 compatible pin out. Thus fully interchangeable ROM/RAM boards are at last a reality, and you get BLINDING speed and LOW power thrown in for virtually nothing.

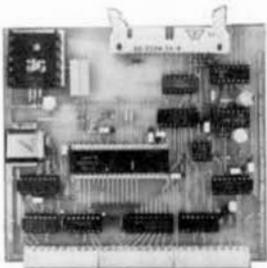

**Digital Research Computers

XDMS DATA MANAGEMENT SYSTEM

The XDMS (eXtended) Data Management System goes beyond the traditional functionality offered by database management systems. It is capable of the normal tabular data manipulations, calculations, sorting, searching and report generation. XDMS adds to these basic features the ability to intermix file data with text to produce custom invoices, contracts and personalized business letters on a mass production or selective basis. XDMS defines a relational structure whereby two files may be linked together via a third. This aspect may be employed to correlate report data on a many-to-one-to-many basis. Advanced record selection permits "driving" reports and inquiries with a file derived from a secondary selection process. All this functionality is available within a single process, controlled by a single user written English-like control file.

XDMS supports sequential, hierarchical and random file structures and employs data compression to permit large files on limited disk space. The hierarchical format further reduces space required. If custom processing or file transfer are required, XDMS files may be easily translated to text format. XDMS files may be defined with up to 24 fields and record lengths up to 255 bytes. Alphanumeric, numeric, decimal, integer, scalar date, coded and hexadecimal field types are supported. Potential keys to other files are simply defined by similar field names, types and sizes. The actual link is established during processing, so that no other preparation is required.

XDMS file input and updating are accomplished via an easy to use facility which offers "editor-like" control, plus field copy, repeat functions, command strings and user defined macros, all invoked by a single keystroke. Tabular and vertical screen modes accommodate most systems including those with "arrow" screen widths. The extended forms feature permits optional user defined control sequences (in assembler) which may be used to control inverse video or highlighting, underlining and other "fancy" functions on the terminal and printer.

XDMS has been designed to provide the user with maximum functionality, and yet be easy to use. No programming experience is required since all processing functions are controlled by high-level non-procedural commands. Whether your needs are for simple list-oriented applications or complex multi-file database networks, XDMS is the answer! XDMS is now available with a set of ten useful data management utilities.

XDMS V1.1 Data Management System plus DMS utilities.....	\$249.95
XACC V1.1 General Accounting System requires XDMS V1.1.....	\$249.45

AMX

Real-Time Multitasking Executive

for
8080, Z80, 6809
and 8086

Gives your application a head start

Save time and money in the development of your product or system by using AMX, the software executive with proven, fault-free operation.

SIMPLE OPERATION

You divide complex control programs into a number of separate, more manageable programs, called tasks, each designed to do one job. This allows tasks to be written and tested separately and then combined to form a reliable, finished system.

AMX supervises the orderly execution of these tasks, assuring that the most important jobs always get done first. Tasks appear to be executing simultaneously. It's almost like having a separate CPU for each task!

HARDWARE INDEPENDENCE

AMX does not require a particular hardware configuration. You control your environment. You pick the I/O method. You decide the preferred interrupt service technique for your system. AMX will support you on the microprocessor of your choice.

AMX is fast, compact, and ROMable. The AMX nucleus, less than 1400 bytes in size, features multiple task priorities, intertask message passing with priority queuing, external event synchronization, and interval timing.

Support modules provide extended memory management, buffer control and resource allocation. Fast, re-entrant integer and floating point math libraries are also available.

AMX interfaces support programs written in C, PASCAL, PL/M, FORTRAN and assembler.

Access to CP/M® disk files in real time is possible using the AMX I/O Supervisor.

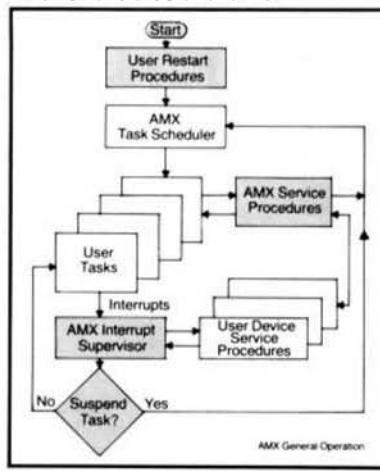

COMPLETE DOCUMENTATION

We deliver AMX source on diskette to permit AMX to be moved to the software development system of your choice. Our liberal license agreement permits binary (object) distribution without royalties.

HOW TO ORDER

A specification sheet and price list are available, free. Your check or money order for \$75 will purchase the AMX Reference Manual for immediate evaluation (specify 8080, Z80, 8086 or 6809 processor). Add \$25 for postage and handling outside USA and Canada. The standard 8080/Z80 AMX Multitasking Executive package, including source code, is \$800. Support modules and interfaces are available separately.

AMX is the choice of professionals the world over. Make it yours, today.

SUPER CPU

...only from
LSI

Yes, it's SUPER-CPU, advanced, new 32 bit processor with power and ability far beyond those of normal CPU's. SUPER-CPU, who can change the course of mighty SS-50 processing, break 68XX benchmarks with its bare MC68000 CPU. And who, disguised as LSI's S88K/08-CPU SS-50c compatible card, fights a never ending battle for speed, power and the SS-50c user.

We're mighty proud of our new processor card. We're giving you the ability to go 68000 without major changes to your system. Our new CPU gives you these advanced features:

- Dynamic partitioning memory management unit with bound check register.
- On-board timer for multi-user/multi-tasking applications.
- On-board boot-strap EPROM and Monitor EPROM space.
- Vectored priority interrupt generator.
- On-board wait state generator.
- User selectable bus options that includes a new higher bandwidth bus mode.
- And many more...

S88K/08-CPU..... \$549.95

CP/M-68K..... \$350.00

ANDERSON COMPUTER CONSULTANTS & Associates

Ron Anderson, respected author and columnist for 68 MICRO JOURNAL announces the Anderson Computer Consultants & Associates, a consulting firm dealing primarily in 68XX(X) software design. Our wide experience in designing 6809 based control systems for machine tools is now available on a consultation basis.

Our experience includes programming machine control functions, signal analysis, multi-axis servo control (CNC) and general software design and development. We have extensive experience in instrumentation and analysis of specialized software. We support all popular languages pertaining to the 6809 and other 68XX(X) processors.

If you are a manufacturer of a control or measuring package that you believe could benefit from efficient software, write or call Ron Anderson. The fact that any calculation you can do with pencil and paper, can be done much better with a microcomputer. We will be happy to review your problem and offer a modern, state-of-the-art microcomputer solution. We can do the entire job or work with your software or hardware engineers.

MACROPLEX Software

175 Fifth Avenue, Suite 3011, New York, NY 10010

Presenting... THE CONDUIT A new File Type for OS9

THE CONDUIT lets programs exchange data without using external files. Direct program-to-program data transfers on any path use OS9 I/O calls. No need to change device-independent programs. Two-way transfers are permitted and device-dependent code can be accommodated. Programs that formerly ran sequentially can now run concurrently to the limit of memory.

Utilities supplied with **THE CONDUIT** give immediate results when linked to your current programs via **CONDUIT** paths:

- Fast disk slowdown speeds up assemblies and other I/O bound procedures.
- "In flight" terminal I/O redirection (e.g., set traps in DEBUG from a disk file).
- Basic9 source inclusions, enhanced listing.
- "Null files" drain output, signal EOF on input.

Free brochure available. Write, or call (212) 686-3036

- tFORTH — extended fig FORTH (1 disk) \$100 (\$15) with fig line editor,
- tFORTH+ — more! (3.5" or 2.8" disks) \$250 (\$25) adds screen editor, assembler, extended data types, utilities, games, and debugging aids.
- TRS-80 COLORFORTH — available from The Micro Works firm FORTH — 6809 only. \$350 (\$10) For target compilations to rommable code. Automatically deletes unused code. Includes HOST system source and target nucleus source. No royalty on targets. Requires but does not include tFORTH+.
- FORTH PROGRAMMING AIDS — elaborate decompiler \$150
- tFORTH for HX-20, in 16K roms for expansion unit or replace BASIC \$170
- tFORTH/68K for CP/M-68K 8" disk system \$290 Makes Model 16 a super software development system.
- Nautilus Systems Cross Compiler
— Requires: tFORTH + HOST + at least one TARGET:
— HOST system code (6809 or 68000) \$200
— TARGET source code: 6800-\$200, 6301/6801-\$200
same plus HX-20 extensions—
6809-\$300, 8080/Z80-\$200, 68000-\$350

Manuals available separately — price in ().
Add \$6 system for shipping, \$15 for foreign air.

TALBOT MICROSYSTEMS

1927 Curtis Ave., Redondo Beach, CA 90278 (213) 376 9941

SS-50 SOFTWARE

FROM THE WORLD'S LARGEST SUPPLIER OF SOFTWARE
FOR FLEX AND OS-9

AS BASIC COMPILER - generates pure text outputted BASIC source code from easy to use 9ASIC source programs for 6809 FLEX or FLEX - \$149.00

DATAVIEW - Screen Editor - A powerful data editor screen editor equal to the task of program preparation and debugged programming. For 6809 OS-9 or FLEX - \$149.00

DATAVIEW - Text Processor - Features all the standard features of a word processor and includes: numbers, single space, double space, bold face, double strike and more. Purchase with DATAVIEW for complete word processing system. For 6809 OS-9 or FLEX - \$149.00

DATAVIEW PASCAL - A full integer only P-Code compiler with complete documentation and examples for the 6809 FLEX and FLEX. Written in assembly for OS-9 - \$149.00 or FLEX - \$149.00 (non-integer, integer to additional \$35.00)

DATAVIEW - A very fast 160BPS Z85 free the people who brought you Frank's Pascal. FLEX - \$149.00

DATAVIEW - A data retrieve utility designed to save you time during the tough manuals looking for info about computer language commands and statements. Written in assembly for 6809 FLEX - \$149.00

AUTOTAB - Consists of a set of memory resident commands that are used in the design of user oriented applications programs. Written in assembler for 6809 FLEX - \$79.00

W/COMMAND - A utility for executing disk resident commands from the resident command \$149.00 (free with purchase of Autotab).

TOOL - Provides a set for FLEX users to test advanced features of a Juke memory system. Provides the user to test extended memory as an additional disk drive. Written for 6809 FLEX - \$149.00

READTEST - A tool for OS-9 writers and programmers reads your test and adds new test to it - \$149.00 written. Assembled for 6809 FLEX - \$149.00

CHASE - Will cross assemble source code into object code for the 6809 FLEX and FLEX. The following: 6809, 6808, 6805, 6802, 1802, Z8, OS-9 version includes 6809 binary, OS-9 system and software for 6803 Video Color Computer OS-9 and FLEX - \$149.00

DISAS - A fast and versatile macro assembler OS-9 memory to memory with substantial memory, comments, labels, and assembly language. Includes a list of labels or symbols. Create OS-9 binary from FLEX and vice versa. For 6809 or FLEX - \$149.00

ED/ASM - ED has all the features of TECY EDITOR - 169, the addition of screen type editing, MACRO capability, and a math package. ASM is compatible with TECY's ASSEMBLER, but with many powerful MACROS and conditions than TECY. For 6809 FLEX - \$149.00

DISAS/ASM - The most attractive BASIC editing available. Fast and easy to use. In assembler for 1099 FLEX - \$149.00

PL-1 - A cross-assembler EDITOR/DEBUGGER written by Caprice Trott. A single pass compiler that converts assembly language to machine code. For 1099 FLEX - \$149.00 (Exclusive US distribution).

MACS - A complete EDITOR ASSEMBLER written by Caprice Trott. Includes TRACE, 4 assembly 1099/125 EDITOR/DEBUGGER ASSEMBLER. For 6809 FLEX - \$149.00

TEL EXTENDED DISC UTILITY - A set of 17 utilities that add the final touch to your utilities for FLEX. Written in assembler for 6809 FLEX - \$149.00

TOOLKIT II - A set 60T expansion. In TECY BASIC, along with DISCUTL and screen refreshers. For 6809 FLEX - \$149.00

TOOLKIT #3 - A package of utilities and programs developed to extend the capabilities of the FLEX operating system. Written in assembler for 6809 FLEX - \$149.00

ARCADE 50

POWERFUL COLOR GRAPHICS

Use the new TMS9916A Video Display processor. High resolution 256 x 192 pixel display with 15 colors. 16K Bytes of onboard RAM does not reduce user memory. 32 graphic images can be individually moved with simple XY commands for smooth animation. External Video input allows substituting NTSC composite video output.

SOUND EFFECTS AND MUSIC

- Three AY38910 Programmable Sound Generators
- Nine simultaneous voices
- Three independent noise sources
- Onboard stereo amplifier drives two 8 ohm speakers

ADDITIONAL I/O CAPABILITIES

- Eight analog inputs with 8 bit resolution
- Supports four joysticks with pushbutton switches
- Eight bit parallel I/O port
- Entire unit maps into 256 bytes of memory

FBASIC

TERMINUS DESIGN INC. in conjunction with Microware Systems Corporation is proud to announce FBASIC an enhancement of Microware's 6800/BASIC. Their last compiled BASIC has been adapted for 6809 users with added video and sound features for ARCADE 50 users. FBASIC is a true compiler that produces optimized machine language modules which are ROMable and require no Run Time BASIC. FBASIC requires less memory overhead and runs hundreds of times faster than BASIC interpreters. It supports standard BASIC instruction including String functions Disk I/O and integer arithmetic with multiple-precision capability. Graphics verbs and functions fully support the Arcade 50.

HARDWARE DESIGNERS

Cut Your Design Time In Half!

Our TSL 6809/6802 MPU Emulator Allows You To Do Just That!

Tired of troubleshooting 6809/6802 based systems with an oscilloscope alone? Is the continual EPROM blowing during software development slowing you down? If your answer to either question is "yes," TSL's 6809/6802 MPU Emulator could be the time-saver you have been waiting for. Our Emulator requires no hardware modifications to your SWTPC computer.

TSL's 6809/6802 MPU Emulator for Southwest Technical Computers...

- Examines external hardware addresses from the keyboard of the SWTPC computer (using the TSL's EM-BUG monitor).
- Executes in Southwest RAM development software which addresses external hardware.
- Sets hardware breakpoint for memory location: read attempt, write attempt, and access attempt.
- Sets up to 10 software breakpoints (SWI type).

System Requirements:

SWTPC computer with 20-bit addressing
Fully decoded memory boards
FLEX™ operating system

Emulator Package contains:

One SS-50 Emulator board
EM-BUG monitor (in ROM)
EM-SWTPC configuration program
on disk
All Interconnecting cables
User's manual

At \$695.00 TSL's EMULATOR could pay for itself with your first program. Call 314/343-9140 and ask to speak with one of our design engineers or write to: Teknar of St. Louis, 306 Axminster Drive, Fenton, MO 63026.

TERMS: VISA, MasterCard, Check or money order. Mo. residents add \$39.00 tax. Foreign countries pay in U.S. dollars. Normal Delivery: Stock to 2 weeks. Shipped U.P.S. in continental U.S.A. Best way to foreign countries.

OS-9 SOFTWARE

Clearbrook Software Group Inc.

OS-9 SOFTWARE

Disk Utilities \$49 (CSG-DUP) —

Four utilities designed to save you time (and typing). DDir — display a directory listing of one or more directories or of an entire disk. DCopy — copy files in one or more directories or an entire disk with or without prompting. DDel — Delete files in one or more directories or an entire disk. DAttr — re-attribute files or change owner I.D. for files in one or more directories or an entire disk. All utilities allow wild card file specification (partial filename, attribute and own I.D.) and have the ability to use AND, OR and NOT logic for file specification relations.

DEdit \$39 (CSG-DEDIT) — A screen oriented disk editor. DEdit allows the user to view and modify any readable sector on an OS-9 format disk. A terminal will clear screen and cursor addressing instructions is required. Data is displayed in hexadecimal, ASCII and binary formats. Modifications to a sector are made by moving the cursor to the byte(s) to be changed, typing the correct data and issuing an Update command. (Written in machine language.)

BT9 \$59 (CSG-BT9) — A binary tree filing program. BT9 makes it easy to write BASICOS9 programs in which files must be maintained in sorted order. Three types of files are supported: Index File, Indexed Data File and Non-indexed Data File. BT9 also allows for maintaining several indexes for one file. All sorting is performed on disk leaving more memory free for other programs. BT9 is written in machine language for fast operation (typical search time under two seconds for a file of 2000 records).

SPECIAL OFFER — Order 2 CSG products and deduct 10%. Order all 3 products and deduct 15%.

Send Certified Cheque or Money Order to: Clearbrook Software Group, Box 8000, Suite 499, Sumas, WA 98295. In Canada, write: Box 8000, Suite 499, Abbotsford, B.C. V2S 1K3.

Call (604) 853-8118 for information.
Specify 8 inch or 5 inch format.

FIRST CLASS

INTELLICOM
INTELLIGENT COMMUNICATIONS Program

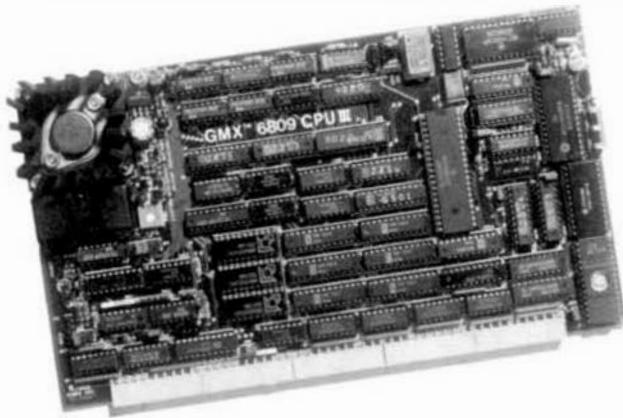

INTELLICOM provides you with the capability of intelligent computer to computer communications from both a terminal emulation and file transfer standpoint. INTELLICOM supports several file transfer protocols that facilitate the transfer of both binary and ASCII data. Since INTELLICOM is menu driven, it is a breeze to use and understand. With INTELLICOM you will be able to communicate with the various data and timesharing services such as The Source and CompuServe. Additionally, since INTELLICOM supports the protocol used by virtually all remote CP/M systems around the world, all users can immediately begin to take advantage of the wealth of public domain software available on these systems. Current, or potential, users of CompuServe can transmit and receive both binary and ASCII data with full error detection and recovery. The checksum protocols allow for the verifications of data blocks transferred (assuming appropriate support on the host end). This feature will be of great value in those applications where data integrity is paramount. INTELLICOM's documentation includes a detailed description of all protocols used along with machine readable examples of host pseudo code. A telephone directory and dialing facility compatible with Hayes Smartmodems is supported.

GIMIX STATE OF THE ART 6809 SYSTEMS FOR THE SERIOUS USER.

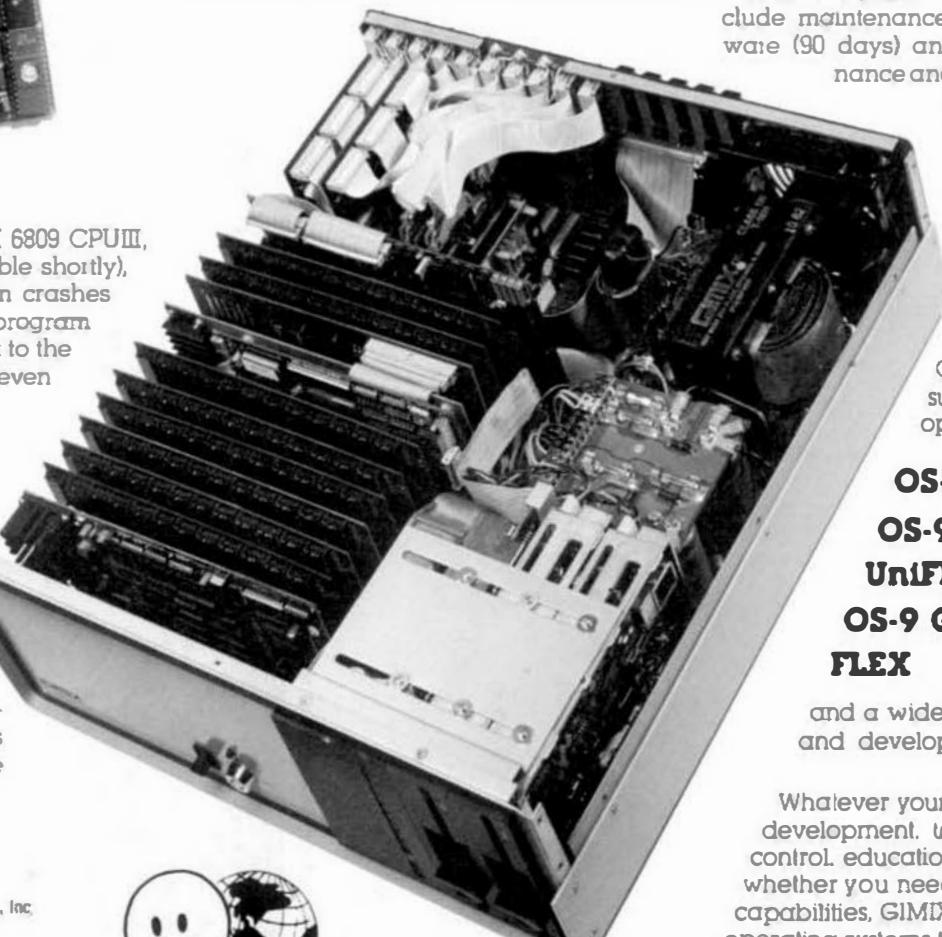

For the ultimate in performance, the Unique GMX 6809 CPU III, using either OS-9-GMX III or UniFLEX GMX III (available shortly), gives protection to the system and other users from crashes caused by defective user programs. e.g. During program development, a programmer who crashes goes back to the shell or the debugger, while the other users are not even aware anything occurred.

The intelligent serial I/O processor boards significantly reduce system overhead by handling routine I/O functions, thereby freeing up the host CPU for running user programs. This speeds up system performance and allows multiple terminals to be used at 19.2K baud.

BASIC-09 and OS-9 are trademarks of Microware Systems Corp. and MOTOROLA, Inc. FLEX and UniFLEX are trademarks of Technical Systems Consultants, Inc. GIMIX, GHOST, GMX, CLASSY CHASSIS, are trademarks of GIMIX, Inc.

GIMIX has 19MB or high performance 47MB Winchester Drive Systems and/or Floppy Disk Drive Systems.

For the user who appreciates the need for a bus structured system using STATIC RAM and powered by a ferro resonant constant voltage transformer.

GIMIX has single user systems that can run both FLEX and OS-9 or Multi user systems for use with UniFLEX or OS-9.

GIMIX versions of OS9 and UniFLEX include maintenance and support by Microware (90 days) and TSC (1 year). Maintenance and support after this period are available at extra cost.

(NOTE: this support and maintenance is only for use with approved GIMIX hardware)

GIMIX 6809 systems support five predominant operating systems

**OS-9 GMX III,
OS-9 GMX II,
UniFLEX,
OS-9 GMX I,
FLEX**

and a wide variety of languages and development software

Whatever your application, software development, instrumentation, process control, educational, scientific or business, whether you need single or multi-user capabilities, GIMIX has hardware and the operating systems to get the job done reliably.

Please phone or write if you need further information

MEMORY • MEMORY • MEMORY • MEMORY

Hazelwood Computer Systems presents a pair of advanced
memories for S-50 or S-64 systems.

256K

\$995

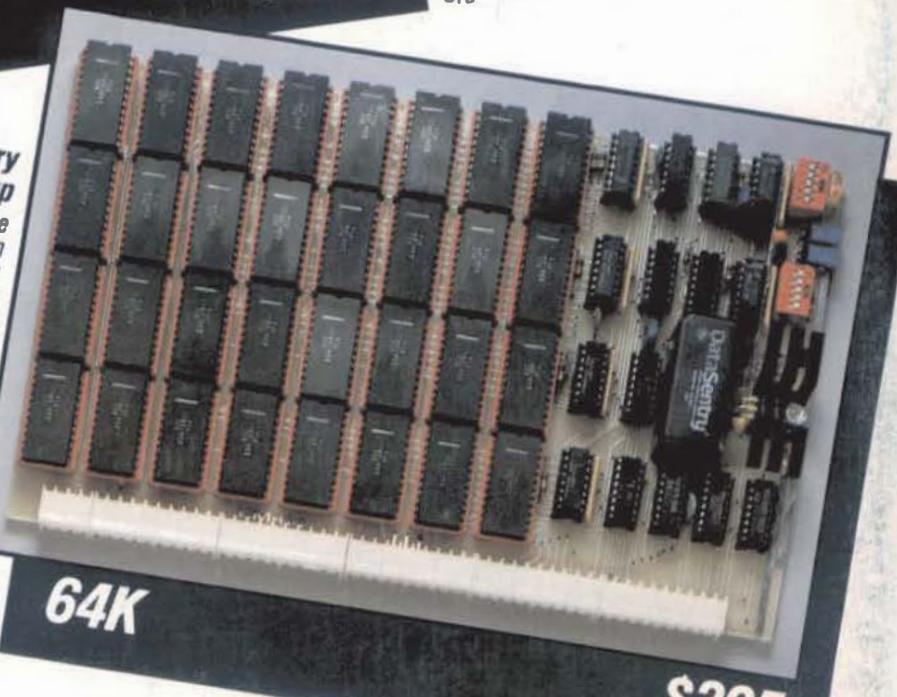

Dynamic memory with guaranteed 2.5 MHz operation

The DM-256 utilizes the same proven refresh method as our original DM-64. This technique allows fully transparent refresh while maintaining full bus speed and eliminating difficult timing problems.

In addition, individual power regulators for each row of memory ICs enhance reliability by providing the ultimate in noise decoupling. Flexible addressing mode controls make the entire 256K available to OS9 Level 2 or UniFLEX. For FLEX, the furnished utility program HYPERDSK™ formats memory not used by FLEX as a virtual, superfast disk, thus tremendously improving total system performance.

With several hundred already in use, the DM-256 is the best choice for economical, reliable memory.

Assembled, tested, and burned in
Order: DM-256

64K

\$395

Static memory with on-board battery backup

Utilizing the latest in low power CMOS static RAMs, the CM-64 has an on-board NiCad battery to maintain memory contents in the absence of bus power. Generous timing margins allow operation at bus speeds in excess of 2 MHz. Zener diode power loss sensing inhibits write operations to prevent data loss during power transitions. Write access can be explicitly controlled by means of an on-board jumper, a remote mounted switch, or an external logic signal.

This allows the memory to appear as ROM to the computer after the contents have been "programmed" using normal computer operations. The economical price makes the advantages of non-volatile memory available to any system.

Assembled, tested, and burned in
Order: CM-64
